## 1.0 Executive Summary

Article 1, Section 75560 of the California Water Code requires that a Water Conservation District that proposes to levy a groundwater charge “... shall annually cause to be made an engineering investigation and report upon groundwater conditions of the District.” In accordance with these requirements, the San Bernardino Valley Water Conservation District (District) must make the following findings and determinations as they relate to the ground and surface water conditions of the Bunker Hill Basin and those areas within the District boundary. Refer to **Figure 1** for locations.

- Task 1.** Annual change in storage for the Bunker Hill Basin for the preceding water year (Fall 2006 to Fall 2007);
- Task 2.** Accumulated change in storage of the Bunker Hill Basin as of the last day of the preceding water year (June 30, 2007);
- Task 3.** Total groundwater production from the Bunker Hill Basin for the preceding water year (July 1, 2006 - June 30, 2007);
- Task 4.** Estimate of the annual change in the Bunker Hill Basin storage for the current water year (July 1, 2007 - June 30, 2008);
- Task 5.** Estimate of the annual change in the Bunker Hill Basin storage for the ensuing water year (July 1, 2008 - June 30, 2009);
- Task 6.** Average annual change in Bunker Hill Basin storage for the immediate past ten water years (1997 - 2007);
- Task 7.** Estimated amount of agricultural water and other than agricultural water to be withdrawn from the groundwater supplies of the District for the ensuing water year (July 1, 2008 - June 30, 2009);
- Task 8.** Estimated amount of water necessary for surface distribution for the ensuing water year for the Bunker Hill Basin and the District (July 1, 2008 - June 30, 2009); and
- Task 9.** The amount of water that is necessary for the replenishment of the groundwater supplies of the Bunker Hill Basin and the District for the ensuing water year (July 1, 2008 - June 30, 2009).

---

To make the findings and determinations listed above, District staff researched available hydrogeologic and engineering data for the Bunker Hill Basin. These data were compiled and analyzed and a predictive relationship between precipitation, production, and change in basin storage was developed. This relationship, based on empirical data, enables the prediction of change in storage, given certain annual production and precipitation levels. In addition, annual and accumulated change in storage values were calculated based on historic water level changes throughout the Bunker Hill Basin.

Based on 20 measuring stations, precipitation throughout the contributing watershed was 33 percent of normal for the period October 1, 2006 to September 31, 2007. The amount of groundwater storage in the Bunker Hill Basin decreased by 113,900 acre-feet.

The required findings for the 2008 Engineering Investigation are provided below. Each of the tasks is further explained in the main body of the report. Throughout this document a positive sign (+) denotes an increase in groundwater storage or groundwater level elevation while a negative sign (-) denotes a decrease in groundwater storage or groundwater level elevation.

---

---

## Summary of Findings for the 2008 Engineering Investigation

---

**Task 1.** Annual change in storage for the Bunker Hill Basin for the preceding water year (Fall 2007 groundwater levels)

- Change in storage between Fall 2006 and Fall 2007

**-113,900 acre-feet (decrease)**

**The amount of water stored in the Basin decreased by 113,900 acre-feet between 2006 and 2007.**

**Task 2.** Accumulated change in storage of the Bunker Hill Basin as of the last day of the preceding water year (June 30, 2007)

- Accumulated change in storage between Fall 1993 and Fall 2007<sup>1</sup>

**-359,400 acre-feet (decrease)**

**The amount in storage in the Fall of 2007 is 359,400 acre-feet less than in the Fall of 1993.**

**Task 3.** Total groundwater production from the Bunker Hill Basin for the preceding water year (July 1, 2006 - June 30, 2007)

**209,739 acre-feet**

---

<sup>1</sup> In the District's Engineering Investigation (EI) prior to 1993-94, the accumulated change in storage was based on the basin storage in 1984 as considered full. A concern arose regarding the flooding of basements due to high groundwater levels in the Pressure Zone of the Bunker Hill Basin. Therefore, in response to the City of San Bernardino's comments on accumulated change in storage, all EI's since that time are based on 1993 basin storage levels considered as full.

---

**Task 4.** Estimate of the annual change in the Bunker Hill Basin storage for the current water year (July 1, 2007 - June 30, 2008)

**-13,440 acre-feet (decrease)**

**The amount of water in the Basin is estimated to decrease by 13,440 acre-feet during the current water year.**

**Task 5.** Estimate of the annual change in the Bunker Hill Basin storage for the ensuing water year (July 1, 2008 - June 30, 2009)

**-7,826 acre-feet (decrease)**

**The amount of water in the Basin is estimated to decrease by 7,826 acre-feet during the ensuing water year.**

**Task 6.** Average annual change in Bunker Hill Basin storage for the immediate past 10 water years (1997 - 2007)

**-41,400 acre-feet (decrease)**

**Task 7.** Estimated amount of agricultural water and other than agricultural water to be withdrawn from the groundwater supplies of the District for the ensuing water year (July 1, 2008 - June 30, 2009)

- Estimated amount of agricultural water withdrawn from the groundwater supplies within the District boundary for the ensuing water year (July 1, 2008 - June 30, 2009)

**17,133 acre-feet**

- 
- Estimated amount of other than agricultural water withdrawn from the groundwater supplies of the District for the ensuing water year (July 1, 2008 - June 30, 2009)

**101,518 acre-feet**

- Task 8.** Estimated amount of water necessary for surface distribution for the ensuing water year for the Bunker Hill Basin and the District (July 1, 2008 - June 30, 2009)

- Estimated amount of water necessary for surface distribution for the ensuing water year (July 1, 2008 - June 30, 2009) for the Bunker Hill Basin

**43,334 acre-feet**

- Estimated amount of water necessary for surface distribution for the ensuing water year (July 1, 2008 - June 30, 2009) within the District boundary

**34,705 acre-feet**

- Task 9.** The amount of water necessary from all sources, including natural recharge, to maintain constant groundwater supplies in the Bunker Hill Basin for the ensuing water year (July 1, 2008 to June 30, 2009)

- The amount of water necessary from all sources, including natural recharge, to maintain constant groundwater supplies in the Bunker Hill Basin for the ensuing water year (July 1, 2008 to June 30, 2009)

**203,616 acre-feet**

- 
- The amount of water necessary from all sources, including natural recharge, to maintain constant groundwater supplies within the District boundary for the ensuing water year (July 1, 2008 to June 30, 2009)

**122,564 acre-feet**

- The amount of water necessary from all sources, including natural recharge, to bring the basin back to "full" in the ensuing water year (July 1, 2008 to June 30, 2009)

**576,456 acre-feet**

In addition to the above findings, Section 75505 of the California Water Code requires that a finding be made as to the amount of water necessary to be replaced in the intake areas of the groundwater basins within the District to prevent the landward movement of salt water into the fresh groundwater body, or to prevent subsidence of the land within the District. Because of its location and the elevations of its water table, the Bunker Hill Basin is not subject to salt-water intrusion and the current groundwater levels will not result in any significant land subsidence.

Section 75540 of the California Water Code requires that the District Board establish a zone or zones where a groundwater charge is to be implemented. The Code specifically states that a single zone may include the entire District and in May 1993 the Board established the entire District as one zone. This determination may be amended in the future, but lacking any evidence to the contrary, in the 2008-09 year the entire District will remain as a single zone in regard to any groundwater charge.

Section 75561 of the California Water Code further requires the Engineering Investigation to include a finding related to the amount of water the District is obligated by contract to purchase. At this time the District has no contractual obligation to purchase water for the replenishment of the groundwater supplies.

---

**Based on the results of the 2008 Engineering Investigation, the San Bernardino Valley Water Conservation District finds that:**

- Due to the imbalance between groundwater recharge and production since 1993, the Bunker Hill Basin's storage is 359,400 acre-feet below that which is considered full for purposes of this Investigation.
- During the ensuing water year (July 1, 2008 to June 30, 2009), the Bunker Hill Basin can be recharged, from all sources, with 575,657 acre-feet of water. This recharge quantity is needed to maintain the 1993 storage level considered full.
- The District should continue to take the necessary steps to enhance its capability to conduct recharge operations, which includes consideration of new, or maintenance and repair of existing, diversion facilities, canals, dikes, basins, roads, and other water recharge facilities. These improvements are required to ensure that the increasing demands on the Basin, especially during drought periods, can be met.

---

## 2.0 *Introduction*

### 2.1 *Purpose and Scope*

The San Bernardino Valley Water Conservation District (District) was created by popular vote in 1931 for the purpose of managing the recharge activities that were previously conducted by the Water Conservation Association. The Water Conservation Association was incorporated in 1909 and had been diverting flows from the Santa Ana River for groundwater recharge since 1911. Currently the District has ownership, as well as easements and/or use of properties owned by the Bureau of Land Management (BLM), on a total of 3,735 acres within the Santa Ana River and Mill Creek Wash areas. The District boundary covers an area of approximately 50,000 acres, which represents about 60 percent of the Bunker Hill Basin. **Figure 1** displays the project area map for the Engineering Investigation. It includes the District boundary along with its location relative to the Interstate and State highways.

Article 1, Section 75560 of the California Water Code requires that a Water Conservation District that proposes to levy a groundwater charge "... shall annually cause to be made an engineering investigation and report upon groundwater conditions of the District." In accordance with these requirements, the San Bernardino Valley Water Conservation District (District) must make the following findings and determinations as they relate to the ground and surface water conditions of the Bunker Hill Basin and those areas within the District boundary.

- Task 1.** Annual change in storage for the Bunker Hill Basin for the preceding water year (Fall 2006 to Fall 2007);
- Task 2.** Accumulated change in storage of the Bunker Hill Basin as of the last day of the preceding water year (June 30, 2007);
- Task 3.** Total groundwater production from the Bunker Hill Basin for the preceding water year (July 1, 2006 - June 30, 2007);

- 
- Task 4.** Estimate of the annual change in the Bunker Hill Basin storage for the current water year (July 1, 2007 - June 30, 2008);
- Task 5.** Estimate of the annual change in the Bunker Hill Basin storage for the ensuing water year (July 1, 2008 - June 30, 2009);
- Task 6.** Average annual change in Bunker Hill Basin storage for the immediate past ten water years (1997 - 2007);
- Task 7.** Estimated amount of agricultural water and other than agricultural water to be withdrawn from the groundwater supplies of the District for the ensuing water year (July 1, 2008 - June 30, 2009);
- Task 8.** Estimated amount of water necessary for surface distribution for the ensuing water year for the Bunker Hill Basin and the District (July 1, 2008 - June 30, 2009); and
- Task 9.** The amount of water that is necessary for the replenishment of the groundwater supplies of the Bunker Hill Basin and the District for the ensuing water year (July 1, 2008 - June 30, 2009).

To make the findings and determinations listed above, District staff researched available hydrogeologic, precipitation, and engineering data for the Bunker Hill Basin and surrounding areas. These data were compiled and analyzed and a predictive relationship between precipitation, production, and change in basin storage was adapted from similar relationships developed by Geoscience Support Services in the preparation of previous Engineering Investigations. This relationship, based on empirical data, enables the prediction of change in storage, given certain annual production and precipitation levels. In addition, annual and accumulated change in storage was calculated based on historic water level changes throughout the Bunker Hill Basin.

## ***2.2 Location, Topography and Climate***

The Bunker Hill Basin is located at the top of the Santa Ana River Watershed and receives all the surface water runoff from the headwaters of the Santa Ana River, Mill Creek, and a portion of that from the Lytle Creek area. It is part of the inland valley called the San Bernardino Valley located in San Bernardino County, California and

---

encompasses approximately 89,600 acres. Once past the Bunker Hill Basin, the Santa Ana River continues to flow southwesterly for approximately 60 miles until it reaches the Pacific Ocean.

The Bunker Hill Basin is bounded on the northwest by the San Gabriel Mountains, on the northeast by the San Bernardino Mountains, on the south by the Crafton Hills and the Badlands, and on the southwest by a low east-facing escarpment produced by the San Jacinto fault. These geologic features are presented on **Figure 2**.

The major streams providing inflows and outflows for the Bunker Hill Basin are also provided on **Figure 2**. The United States Geological Survey (USGS) administers stream flow gauging stations on all of these waterways except Mill Creek. Mill Creek flow is assumed to be 56 percent of the Santa Ana River flow based on historic data. Total diversions for direct use and recharge on the Santa Ana River may exceed the stream flows due to measurements by different agencies.

The climate in the region is a semi-arid Mediterranean-type characterized by long dry summers and relatively short mild winters. The annual average temperature in the valley is 62° F, with extremes ranging from as low as 18° F to as high as 116° F. Precipitation in the region is highly variable depending on location and elevation. Historical annual averages range from 10.8 inches near Loma Linda Fire Department located at the southwest end of the basin to over 40.6 inches at Lake Arrowhead located at the upper end of the mountain watershed contributing flow to the basin. Precipitation data provided by the Water Resources Division of the San Bernardino County Department of Transportation for 20 stations are summarized in **Table 1** and displayed on **Figure 3**.

### **2.3 Definition of Terms**

For the purposes of this report, the following terms are defined:

- ◆ Bunker Hill Basin - The Bunker Hill Basin is the groundwater basin that underlies the San Bernardino Valley. By strict definition the Bunker Hill Basin is separate from the

---

Lytle Groundwater Basin, but receives groundwater underflow from the Lytle Basin. For the purposes of this report, the definition of the Bunker Hill Basin is extended to include the Lytle Basin.

- ◆ Production - The term production includes extraction of water by groundwater pumping from wells and surface diversions from the Santa Ana River, Mill Creek, City Creek, Devil Canyon Creek, Cajon Creek, Plunge Creek, and Lytle Creek.
- ◆ Preceding Water Year - As per the California Water Code, the preceding water year is the period July 1, 2006 through June 30, 2007.
- ◆ Current Water Year - As per the California Water Code, the current water year is the period July 1, 2007 through June 30, 2008.
- ◆ Ensuing Water Year - As per the California Water Code, the ensuing water year is the period July 1, 2008 through June 30, 2009.

## **2.4 Sources of Data**

Data used in the development of this engineering investigation were obtained from a variety of sources including public and private agencies. The data analysis tasks involved tabulating and summarizing information from documented and undocumented reports, public and private files, and personal communication with local, State, and Federal agencies. Some of the more important data sources are listed below.

Data for Fall 2007 groundwater elevations and preceding water year (July 2006 to June 2007) production were obtained from the primary water purveyors in the Bunker Hill Basin including:

- City of Colton
- City of Loma Linda
- City of Redlands
- City of Rialto

- 
- City of Riverside
  - City of San Bernardino
  - East Valley Water District
  - Elsinore Valley Municipal Water District/Meeks and Daley Water Company
  - Gage Canal Company
  - Geologic Associates
  - Loma Linda University
  - Patton State Hospital
  - Redlands Farming, Inc.
  - Riverside – Highland Water Company
  - San Bernardino County Department of Transportation and Flood Control
  - San Bernardino Valley Municipal Water District
  - West Valley Water District
  - Western Municipal Water District
  - United States Geological Survey, Santee, CA Office

Data regarding historic diversions from the Santa Ana River, Mill Creek, Plunge Creek, City Creek, Devil Canyon Creek, Cajon Creek, and Lytle Creek were obtained from the following sources:

- San Bernardino Valley Water Conservation District (acting as Project Manager for the Cooperative Water Project - Exchange Plan)
- Western Municipal Water District
- City of San Bernardino

Historic precipitation data were obtained from the following sources:

- San Bernardino County Department of Transportation and Flood Control
- Redlands Daily Facts
- Big Bear Grizzly

### **3.0 Fall 2007 Groundwater Elevation Contours**

The District, the Western Municipal Water District, and the primary water purveyors in the Bunker Hill Basin provided Fall 2007 water level data. Static groundwater elevations for Fall 2007 for wells throughout the Bunker Hill Basin are compiled in **Appendix A**. These elevations were plotted on **Figure 4** for 132 wells using a Geographic Information System (GIS) and groundwater elevation contours for the Bunker Hill Basin were interpreted. For purposes of comparison, Fall 2006 static groundwater elevation contours are provided on **Figure 5**. **Figure 6** shows the delineation of the Bunker Hill Basin into the sub-areas used in this report.

#### **3.1 Hydrographs for Key Wells in the Bunker Hill Basin**

To provide an historical perspective of groundwater levels for the Bunker Hill Basin, hydrographs for 21 wells located throughout the basin are shown in **Appendix B**. The locations of these wells are shown on **Figure 7** and the annual changes in water level from Fall 2006 to Fall 2007 are shown in **Table 2**.

## **4.0 Task 1 - Annual Change in Storage (Fall 2006 to Fall 2007)**

### **4.1 Hydrologic Sub-areas**

Using a Geographic Information System, the average groundwater elevation changes were determined for each of the eight hydrologic sub-areas shown on **Figure 6** and listed below.

- Bunker Hill I - Southwest of Interstate 215
- Bunker Hill I - Northeast of Interstate 215
- Bunker Hill II - West of Mentone Fault
- Bunker Hill II - East of Mentone Fault
- Lytle Basin - Southeast of Barrier J
- Lytle Basin - Northwest of Barrier J
- Pressure Zone - North of Santa Ana Wash
- Pressure Zone - Santa Ana Wash

---

Due to variations of changes in groundwater level elevation, the Bunker Hill II - East of Mentone Fault was further subdivided into storage units North of Redlands Fault and Southeast of Redlands Fault. These storage units are also shown on **Figure 6**.

#### **4.2 Area and Storativity**

Each sub-area and storage unit was digitized to estimate its area. Average storativity for each sub-area was determined based on data from Hardt and Hutchinson (1980). Both of these values are shown in **Table 3**. Storativity values ranged from 0.02 for the Pressure Zone to 0.13 for the Lytle Basin - Northwest of Barrier J and Bunker Hill II - East of the Mentone Fault.

#### **4.3 Groundwater Level Elevation Changes**

In order to determine the annual change in storage for the Bunker Hill Basin, Fall 2007 groundwater level elevation data were compared with the same from Fall 2006. Measurements for 231 wells were available for both periods and the differences are provided in **Appendix A**. These differences are plotted on **Figure 8** using a graduated symbol color. Those wells with the largest decline in groundwater elevation are shown in red, while those with the largest increase are displayed in blue.

Average changes in groundwater levels were determined by averaging the changes for all wells in each of the eight sub-areas and storage units as shown in **Table 3**.

#### **4.4 Change in Groundwater Storage**

The total annual change in storage for the Bunker Hill Basin was determined by summing the changes from each sub-area. Changes in groundwater storage for the period Fall 2006 to Fall 2007 for the Bunker Hill Basin were calculated using the following formula:

$$Q_{\Delta \text{ storage}} = \sum A_i \times S_i \times \Delta h_i$$

where:

$Q_{\Delta \text{ storage}}$  = Annual change in storage for the Bunker Hill Basin, (acre-feet)

$A_i$  = Area of sub-area and storage unit  $i$ , (acres)

$S_i$  = Storativity of sub-area and storage unit  $i$

$\Delta h_i$  = Average water level change of sub-area and storage unit  $i$ , (feet)

As shown in **Table 3**, the change in groundwater storage for the Bunker Hill Basin between Fall 2006 and Fall 2007 was a decrease of 113,900 acre-feet.

## 5.0 **Task 2 - Accumulated Change in Storage (Fall 1993 to Fall 2007)**

For purposes of this report, the accumulated change in storage as of the last day of the preceding water year (June 30, 2007) was based on the changes in water levels between Fall 1993, when the accumulated basin change in storage was considered “zero”, and the Fall of 2007.<sup>2</sup> The accumulated change in storage as of June 30, 2007 was determined by adding the change in storage for the preceding water year (July 1, 2006 to June 30, 2007) of (-113,900 acre-feet), determined in Section 4.4, to the accumulated change in storage as of June 30, 2006 (-245,500). The result of this calculation is an accumulated decrease in storage for the Bunker Hill Basin of 359,400 acre-feet.

<sup>2</sup> In the District's Engineering Investigation (EI) prior to 1993-94, the accumulated change in storage was based on the basin storage in 1984 as considered full. A concern arose regarding the flooding of basements due to high groundwater levels in the Pressure Zone of the Bunker Hill Basin. Therefore, in response to the City of San Bernardino's comments on accumulated change in storage, all EI's since that time are based on 1993 basin storage levels considered as full.

---

**Table 4** summarizes the accumulated change in storage of the Bunker Hill Basin for the period 1987 to 2007 based on 1993 as the “zero accumulated storage year”. The accumulated storage values are also displayed on **Figure 9** with the percent of normal precipitation for the San Bernardino County Hospital station. As would be expected, storage generally increases with above average rainfall and decreases with normal and below average rainfall.

## **6.0 Task 3 - Total Groundwater Production for the Preceding Water Year (July 1, 2006 to June 30, 2007)**

Production data for the preceding water year (July 1, 2006 to June 30, 2007) for the Bunker Hill Basin were obtained from the primary water purveyors as listed in Section 2.4. Production data for wells owned by some smaller water agencies were not available and were estimated using previous year and calendar year 2006 data published by the Western - San Bernardino Watermaster and Western Municipal Water District, respectively.

**Appendix C** shows the production for each groundwater well in the Bunker Hill Basin for the period July 2006 through June 2007. As summarized on the last page of the appendix, groundwater production from the Bunker Hill Basin for the preceding water year was approximately 209,739 acre-feet. **Table 5** summarizes the Bunker Hill Basin groundwater production for each of the sub-areas defined in Section 4.1.

Groundwater production within the Bunker Hill Basin during the period July 2006 through June 2007 is shown on **Figure 10**. Each well is displayed with a graduated size symbol based on its annual production. The Pressure Zone has the greatest density of higher producing facilities with pockets of substantial production scattered throughout the rest of the basin.

## 7.0 **Task 4 - Estimate of the Annual Change in Storage for the Current Water Year (July 1, 2007 to June 30, 2008)**

To estimate annual change in storage for the current water year, a multiple regression analysis was performed for the period between 1991-92 and 2004-05 for three parameters.

- Annual Change in Storage
- Precipitation
- Production

In Engineering Investigations (EI) prior to 1998, data for the period 1982 calendar year through 1991 calendar year were also utilized in the regression analysis. The only production data available for this time frame were based on a calendar year period instead of the June to July period required in the EI. Since 1991-92 more accurate and more complete production data for the July to June period have become available as the District has compiled detailed information for its EI. Since 1998, the regression analysis has not included pre-1991 data to more accurately represent June though July production.

Annual change in storage for the current water year is estimated using the following relationship between change in storage, precipitation, production, and the calculated regression coefficients.

$$Q_{\text{Annual } \Delta \text{ storage}} = -221,564 + 8,171 Q_{\text{prec}} + 0.125 Q_{\text{prod}}$$

where:

$Q_{\text{Annual } \Delta \text{ storage}}$  = Annual change in storage, (acre-feet)

$Q_{\text{prec}}$  = Annual Precipitation, inches

$Q_{\text{prod}}$  = Annual Production, acre-feet

---

A nomograph, constructed using the above equation, is shown on **Figure 11**. Through the use of this chart or the equation above, annual change in storage can be estimated for a given set of annual precipitation and production values. The precipitation used in the nomograph is based on the average of the representative Bunker Hill Basin drainage area stations listed in **Table 6**.

The average annual precipitation for eight of the ten stations with recent data is approximately 22.5 inches (**Table 6**), while the average for the preceding water year was 7.9 inches (35 percent of normal). Historic annual precipitation values are plotted in **Appendix D** for these eight stations and twelve other local stations.

**Table 6** shows that for the period between July 2007 and December 2007, precipitation was 89 percent of normal for the eight stations with data. For purposes of this report, it was assumed that precipitation for the rest of the current water year (January 2008 to June 2008) would be average. Therefore, precipitation for the current water year (July 2007 to June 2008) was estimated to be 97 percent of normal or 21.8 inches of rainfall ( $0.97 \times 22.5$ ).

Based on these assumptions, the estimated production for the current water year will be approximately 239,972 acre-feet as shown on **Figure 12**. Using this result on **Figure 11**, an estimated change in storage for the current water year (July 2007 to June 2008) of -13,440 acre-feet was determined.

## **8.0 Task 5 - Estimate of the Annual Change in Storage for the Ensuing Water Year (July 1, 2008 to June 30, 2009)**

The annual change in storage for the ensuing water year (July 1, 2008 to June 30, 2009) was estimated using the same method as described in Section 7.0. It was assumed that precipitation for the ensuing water year would be 100 percent of normal or 22.5 inches. Based on this assumption, the estimated production for the ensuing water year will be approximately 239,124 acre-feet as shown on **Figure 13**. Again, using this result in the nomograph shown on **Figure 11**, the estimated annual change in storage for the ensuing water year (July 1, 2008 to June 30, 2009) is -7,826 acre-feet.

---

## **9.0 Task 6 - Average Annual Change in Storage for the Immediate Past Ten Water Years**

**Table 7** shows the average annual change in storage for the immediate past ten water years (Fall 1997 to Fall 2007) using the same method as described in Section 4.0. By summing the average annual change in storage for each sub-area, a total average annual change in storage for the Bunker Hill Basin for the immediate past ten water years was determined to be -41,400 acre-feet.

## **10.0 Task 7 - Estimated Amount of Agricultural Water and Other Than Agricultural Water to be Withdrawn for the Ensuing Water Year (July 1, 2008 to June 30, 2009)**

The estimated amount of agricultural water and other than agricultural water to be withdrawn within the District for the ensuing water year (July 1, 2008 to June 30, 2009) was based on the following equations:

$$Q_{agr(08-09)} = Q_{agr(06-07)} \times [(Q_{total(08-09)} - Q_{surf(08-09)}) / (Q_{total(06-07)} - Q_{surf(06-07)})]$$

and

$$Q_{non-agr(08-09)} = Q_{non-agr(06-07)} \times [(Q_{total(08-09)} - Q_{surf(08-09)}) / (Q_{total(06-07)} - Q_{surf(06-07)})]$$

where:

- $Q_{agr(08-09)}$  = Agricultural use within the District for the ensuing water year, acre-ft
- $Q_{agr(06-07)}$  = Agricultural use within the District for the preceding water year, acre-ft (Appendix C)
- $Q_{total(08-09)}$  = Production (including surface diversion) from the Bunker Hill Basin for the ensuing water year, acre-ft (Figure 13)
- $Q_{total(06-07)}$  = Production (including surface diversion) from the Bunker Hill Basin for the preceding water year, acre-ft (Appendix C)
- $Q_{non-agr(08-09)}$  = All other uses within the District for the ensuing water year, acre-ft
- $Q_{non-agr(06-07)}$  = All other uses within the District for the preceding water year, acre-ft (Appendix C)
- $Q_{surf(08-09)}$  = Surface diversions from the Bunker Hill Basin for the ensuing water year, acre-ft (Table 8)
- $Q_{surf(06-07)}$  = Surface diversions from the Bunker Hill Basin for the preceding water year, acre-ft (Appendix C)

Data on agricultural use and all other uses within the District for the preceding water year (July 1, 2006 to June 30, 2007) are provided in **Appendix C**. For the period July 1, 2006 through June 30, 2007 approximately 15,135 acre-feet of groundwater was produced for agricultural applications within the District boundary. For the same period, approximately 89,682 acre-feet of groundwater was produced for all other uses within the District boundary. Using the equations presented above with the following values inserted:

$$Q_{agr(06-07)} = 15,135 \text{ acre-feet}$$

$$Q_{total(08-09)} = 239,124 \text{ acre-feet}$$

$$Q_{total(06-07)} = 209,739 \text{ acre-feet}$$

$$Q_{non-agr(06-07)} = 89,682 \text{ acre-feet}$$

$$Q_{surf(08-09)} = 43,334 \text{ acre-feet}$$

$$Q_{surf(06-07)} = 36,777 \text{ acre-feet}$$

The estimated production within the District for the ensuing water year for agricultural uses and other than agricultural uses is:

$$\begin{aligned} Q_{agr(08-09)} &= 15,135 \times [(239,124 - 43,334) / (209,739 - 36,777)] \\ &= 17,133 \text{ acre-feet} \end{aligned}$$

$$\begin{aligned} Q_{non-agr(08-09)} &= 89,682 \times [(239,124 - 43,334) / (209,739 - 36,777)] \\ &= 101,518 \text{ acre-feet} \end{aligned}$$

By summing these two results, it is estimated that 118,651 acre-feet of groundwater will be withdrawn within the District for the ensuing water year (July 1, 2008 to June 30, 2009).

---

## **11.0 Task 8 - Estimated Amount of Water for Surface Distribution for the Ensuing Water Year (July 1, 2008 to June 30, 2009)**

The amount of water for surface distribution for the ensuing water year (July 1, 2008 to June 30, 2009) was estimated based on the average surface diversions for the Santa Ana River, Mill Creek, and Lytle Creek for the period 1983 to 2006.

As shown in **Table 8**, average surface diversions for the Santa Ana River, Mill Creek, and Lytle Creek between 1983 and 2006 were 23,363, 11,342 and 8,629 acre-feet, respectively. Therefore, the total estimated amount of water for surface distribution from the Bunker Hill Basin for the ensuing water year (July 1, 2008 to June 30, 2009) is found by summing the diversions as follows:

$$\text{Bunker Hill Surface Distribution} = 23,363 + 11,342 + 8,629 = 43,334 \text{ acre-feet}$$

As Lytle Creek is not within the District, the estimated amount of surface distribution from the District for the ensuing water year (July 1, 2008 to June 30, 2009) is the sum of the Santa Ana River and Mill Creek distributions.

$$\text{District Surface Distribution} = 23,363 + 11,342 = 34,705 \text{ acre-feet}$$

## **12.0 Task 9 - Estimated Amount of Water for Replenishment of the Groundwater Supplies for the Ensuing Water Year (July 1, 2008 to June 30, 2009)**

The amount of water necessary from all sources, including natural recharge, to maintain constant groundwater supplies in the Bunker Hill Basin for the ensuing water year (July 1, 2008 to June 30, 2009) is estimated as follows:

---

Replenishment = Total Production - Surface Diversions - Change in Storage  
or,

$$Q_{\text{Replenishment (08-09)}} = Q_{\text{prod (08-09)}} - Q_{\text{surf (08-09)}} - Q_{\text{Annual \Delta storage (08-09)}}$$

The estimated production and surface diversions from the Bunker Hill Basin for the ensuing water year (July 1, 2008 to June 30, 2009) were estimated as approximately 239,124 acre-feet (from **Figure 13**) and 43,334 acre-feet (from **Table 8**), respectively. The estimated change in storage determined in Section 8.0 and shown on **Figure 11** is a decrease of 7,826 acre-feet. Therefore, the amount of water necessary for replenishment of the groundwater supplies of the Bunker Hill Basin is estimated as follows:

$$Q_{\text{Replenishment (08-09)}} = 239,124 - 43,334 + 7,826 = 203,616 \text{ acre-feet}$$

The amount of water necessary to maintain constant groundwater supplies within the District for the ensuing water year (July 1, 2008 to June 30, 2009) is estimated using the same equation as shown above, but substituting values for the District area. The estimated production within the District for the ensuing water year is estimated as approximately 118,651 acre-feet (from Section 10.0) and 34,705 acre-feet (from Section 11.0), respectively. The change in storage for the ensuing water year for the District is estimated as a decrease of 3,913 acre-feet (assumed to be half of the Bunker Hill Basin). Therefore, the amount of water necessary for replenishment of the District's groundwater supplies for the ensuing water year (July 1, 2008 to June 30, 2009) is:

$$Q_{\text{Dist Replenishment (08-09)}} = (118,651 + 34,705) - 34,705 + 3,913 = 122,564 \text{ acre-feet}$$

The amount of groundwater recharge that must occur from all sources, including natural recharge, in order to bring the basin back to "full" in the ensuing water year is determined as follows:

---

$$Q_{\text{Replenishment}} = - Q_{\text{Accumulated } \Delta \text{ storage (93-07)}} - Q_{\text{Annual } \Delta \text{ storage (07-08)}} + Q_{\text{Replenishment (08-09)}}$$

$$Q_{\text{Replenishment}} = 359,400 + 13,440 + 203,616 = 576,456 \text{ acre-feet}$$

### **13.0 General Findings**

In addition to the above findings, Section 75505 of the California Water Code requires that a finding be made as to the amount of water necessary to be replaced in the intake areas of the groundwater basins within the District to prevent the landward movement of salt water into the fresh groundwater body, or to prevent subsidence of the land within the District. Because of its location and the elevations of its water table, the Bunker Hill Basin is not subject to salt-water intrusion and the current groundwater levels will not result in any significant land subsidence.

Section 75540 of the California Water Code requires that the District Board establish a zone or zones where a groundwater charge is to be implemented. The Code specifically states that a single zone may include the entire District and in May 1993 the Board established the entire District as one zone. This determination may be amended in the future, but lacking any evidence to the contrary, in the 2008-09 year the entire District will remain as a single zone in regard to any groundwater charge.

Section 75561 of the California Water Code further requires the Engineering Investigation to include a finding related to the amount of water the District is obligated by contract to purchase. At this time the District has no contractual obligation to purchase water for the replenishment of the groundwater supplies.

### **14.0 Conclusions**

Based on the results of the 2008 Engineering Investigation, the San Bernardino Valley Water Conservation District finds that:

- 
- Due to the imbalance between recharge and production since 1993, the Bunker Hill Basin's storage is 359,400 acre-feet below that which is considered full for purposes of this Investigation.
  - During the ensuing water year (July 1, 2008 to June 30, 2009), the Bunker Hill Basin can be recharged, from all sources, with 576,456 acre-feet of water. This recharge quantity is derived by adding together the accumulated deficit as of the end of the preceding water year with the estimated quantity needed to maintain the 1993 storage level considered full.
  - The District should continue to take the necessary steps to enhance its capability to conduct recharge operations, which includes construction of new, or maintenance and repair of existing, diversion facilities, canals, dikes, basins, roads, and other water recharge facilities. These improvements are required to ensure that the increasing demands on the Basin, especially during drought periods, can be met.

# Annual Change in Storage for Bunker Hill Basin

*Fall 2006 to Fall 2007*

Sub-area	[1] Annual Change in Water Level* [ft]	[2] Area [acres]	[3] Storativity ( $S$ )	[4] Annual Change in Storage** [acre-ft]
Bunker Hill I - Southwest of Interstate 215	-18.00	11,714	0.09	-18,977
Bunker Hill I - Northeast of Interstate 215	-18.80	7,795	0.11	-16,120
Bunker Hill II - West of Mentone Fault	-11.02	35,206	0.06	-23,278
Bunker Hill II - East of Mentone Fault				
North of Redlands Fault	-34.20	8,584	0.13	-38,164
Southeast of Redlands Fault	-6.14	2,507	0.13	-2,001
Subtotal				-40,166
Lytle Basin - Southeast of Barrier J	-27.90	5,237	0.07	-10,228
Lytle Basin - Northwest of Barrier J	-15.00	1,924	0.13	-3,752
Pressure Zone - North of Santa Ana Wash	-2.19	11,920	0.02	-522
Pressure Zone - Santa Ana Wash	-6.74	6,686	0.02	-902
Total =				-113,900

[1] Based on average changes in water level within each Sub-area

[2] Estimated using GIS

[3] Based on data from Hardt and Hutchinson (1980).  $S$ , storativity: The amount of water stored or released per unit area of aquifer given unit head change.

[4] = [1] x [2] x [3]

\*A positive sign denotes an increase in water level and a negative sign represents a decline in water level.

\*\* A positive sign denotes an increase in storage and a negative sign represents a decline in storage.

# Accumulated Change in Storage for Bunker Hill Basin

*1987 to 2007 (Based on "Zero Year" of 1993)*

Year	Accumulated Storage [acre-ft]
1987	85,500
1988	3,600
1989	-58,000
1990	-170,700
1991	-196,000
1992	-191,000
1993	0
1994	-50,000
1995	41,100
1996	-43,100
1997	-75,500
1998	40,400
1999	-85,700
2000	-131,100
2001	-212,200
2002	-301,500
2003	-338,800
2004	-406,900
2005	-183,100
2006	-245,500
2007	-359,400

Note: A negative sign indicates a decline in storage and a positive sign represents an increase in storage.

# Production in Sub-basins of Bunker Hill Basin

*Preceding Water Year (July 2006 to June 2007)*

Sub-area	Production July 2006 to June 2007 [acre-ft]
Bunker Hill I - Southwest of Interstate 215	18,808
Bunker Hill I - Northeast of Interstate 215	5,105
Bunker Hill II - West of Mentone Fault	57,606
Bunker Hill II - East of Mentone Fault	8,278
Lytle Basin - Southeast of Barrier J	19,573
Lytle Basin - Northwest of Barrier J	30
Pressure Zone - North of Santa Ana Wash	46,300
Pressure Zone - Santa Ana Wash	53,817
Unknown	223
<b>Total</b>	<b>209,739</b>

## Production Data for the Preceding Water Year

*(July 1, 2006 - June 30, 2007)*

Owner	Recordation Number	State Well Number	Local Name	Basin	Diversion (acre-ft)	Agricultural Production (acre-ft)	Non-agricultural Production (acre-ft)	Sum of Groundwater Production (acre-ft)	Within SBVWCD Boundary	Notes
			Total Diversions Contributing to Bunker Hill Basin		36,777.0	15,165.1	194,574.2	36,777 (acre-ft) 209,739 * (acre-ft) <b>246,516</b> (acre-ft)		
			Total Bunker Hill Groundwater Production							
			Total for Bunker Hill							
			Total Agricultural Groundwater Production Within SBVWCD					15,135 (acre-ft)		
			Total Non-Agricultural Groundwater Production Within SBVWCD					89,682 (acre-ft)		
			Total Within SBVWCD					<b>104,817</b> (acre-ft)		

**Notes:**

1 - Estimated from water year July 2006 - June 2007 production.

2 - Estimated from calendar year 2006 Production. (Watermaster Support Services)

3 - Reported in SBVWCD Groundwater Assessments July 1, 2006 - June 30, 2007 (GWA #27 & GWA #28)

\* Not all production data differentiated between agricultural or non-agricultural use.

FC = File Closed. SWRCB has closed file due to minimal water use, abandonment or lack of correspondence.
