To: Clerk of the Superior Court of San Bernardino County and All Parties

Subject: Watermaster Report for Calendar Year 2020

Gentlemen:

We have the honor of submitting the Forty-Fourth Annual Report of the Big Bear Watermaster for Calendar Year 2020.

Paragraph Twenty (20) of the Judgment requires that the Watermaster Report be submitted to the Court and the Parties before April 1 of each year on all significant Watermaster activities and provide an accounting of water deliveries for the proceeding calendar year as set forth in Section VI, Physical Solutions, of the Judgment.

We and each of us here by certify that this is a true and correct report of the Watermaster work performed by us and under our supervision during 2020 pursuant to the requirement of the Judgment.

Respectfully Submitted,

By: Donald E. Evenson

I. INTRODUCTION

The Big Bear Watermaster presents the Forty-Fourth Annual Report of its activities for calendar year 2020. The Watermaster's activities ensure that the rights of all parties subject to the Judgment rendered in Case No. 165493 are protected. The Watermaster generally oversees watershed conditions that may affect the Judgment and attempts to improve the conditions to the benefit of all parties.

This report describes the 2020 activities of the Watermaster including the status of accounts and various tabulations as required by the Judgment.

In 2020, the Big Bear Watermaster Committee was composed of Donald E. Evenson, President, representing Big Bear Municipal Water District; Samuel H. Fuller, representing Bear Valley Mutual Water Company; and Daniel B. Cozad, Secretary, representing San Bernardino Valley Water Conservation District.

The Watermaster Committee met four times during 2020. These meetings were held on the following dates:

January 22, 2020

March 18, 2020

July 15, 2020

October 13, 2020

Appendix A contains the minutes of these meetings. Minutes of the meetings are also on file at the office of each of the agencies.

II. SUMMARY

2020 WATERMASTER ACCOUNTS

2020 was a below average precipitation year. Annual precipitation at the two gauges in the Big Bear Lake watershed averaged 16.47 inches, which is 67 percent of the 24.48 inches of average annual rainfall since 1977. Precipitation at Bear Valley Dam was 21.50 inches, which is 61 percent of the 111-year (1910-2020) average of 35.00 inches.

Inflow to Big Bear Lake in 2020 was also below average. The 2020 calculated lake inflow was 7,945 acre-feet, which is 53 percent of the average inflow since 1977. The average inflow for the 44 years since the Judgment was rendered is 15,049 acre-feet per year.

Actual lake levels fell 1.70 feet in 2020 and ended the year 13.14 feet below the top of the dam. Accordingly, lake contents decreased by 3,927 acre-feet during the year. On December 31, 2020, the lake contained 38,663 acre-feet of water. When full, the lake level is 72.33 feet and it holds 73,320 acre-feet. **Figure 1** shows the history of the actual lake contents since the Judgment was rendered in 1977.

Mutual's lake account held 29,788 acre-feet at the end of 2020. Their lake account decreased by 2,824 acre-feet during the year. **Figure 1** also shows the history of Mutual's lake account since 1977. Under a "Mutual Operation", lake releases would be made to meet Mutual's water demands and their lake account is credited with the net wastewater exported from the Big Bear Lake watershed. Under these conditions, the lake level would have ended the year at 49.95 feet or 22.38 feet below the top of the dam and 9.24 feet lower than the actual year-end lake level of 59.19 feet. If Mutual had not been credited with the net wastewater exports, their lake account balance would have been 15,775 acre-feet and the lake level would have been 46.80 feet or 25.53 feet below the top of dam, and 12.39 feet lower than it actually was.

In 2020, Mutual received 3,667.5 acre-feet of water from Big Bear MWD. Big Bear MWD has the option to provide In Lieu Water supplies or to release water from the lake. In 2020, Mutual received 3,079.7 acre-feet of In Lieu State Water Project (SWP) Water. Also, Mutual was able to use 587.8 acre-feet of water from Big Bear Lake that was required for fish protection purposes as required under SWRCB Order No. 95-4.

FIGURE 1
ACTUAL LAKE CONTENTS AND MUTUAL'S LAKE ACCOUNT 1977 - 2020
Calendar Year 2020 - Big Bear Watermaster

At the beginning of the year, Big Bear MWD had 18,979 acre-feet in their lake account. By the end of the year, their lake account had decreased by 1,104 acre-feet to 17,875 acre-feet. Big Bear MWD's lake account is the difference between the actual lake contents and Mutual's lake account as shown on **Figure 1**.

The Basin Make-up Account provides an estimate of the water supply impacts of the operation of Big Bear Lake under the Judgment on the San Bernardino Groundwater Basin. A positive account balance means there has been an increase in groundwater recharge as a result of the Big Bear MWD operation of the lake. If the account becomes negative, Big Bear MWD is required to correct the deficiency by providing additional water for groundwater recharge.

In 2020 the Basin Make-up Account balance increased by 18 acre-feet. The Basin Make-up Account began the year with a balance of 27,028 acre-feet and ended the year with a balance of 27,046 acre-feet. The increase resulted primarily as a result of the higher basin additions from lake releases made to meet the requirements of SWRCB Order 95-4 under a Big Bear MWD lake operation as compared to a Mutual Operation.

OTHER WATERMASTER ACTIVITIES

The Watermaster has the responsibility to undertake studies and investigations, collect and maintain data and records, and monitor related activities necessary to implement the physical solution contained in the Judgment. In 2020, the Watermaster was involved in monitoring and discussing two issues. These issues are:

- Impacts of Seven Oaks Dam,
- Protecting Big Bear Lake from Quagga Mussels,

These issues are discussed in Chapter V.

III. BASIC DATA

BIG BEAR LAKE

Summary

The Watermaster conducts a water balance of Big Bear Lake for each month. This water balance is based on measurements of lake levels, releases, leakages, and air temperature, as well as calculated values of spills, evaporation, and inflows. For 2020, the overall water balance for the lake was:

Initial Storage (1-1-20)	42,590 acre-feet
Inflows	7,945 acre-feet
Evaporation	10,608 acre-feet
Releases for Mutual	-0- acre-feet
Releases for Valley District	-0- acre-feet
Releases & Leakage for SWRCB Order 95-4	671 acre-feet
Spills & Flood Control Releases	-0- acre-feet
Net Snowmaking Withdrawal	593 acre-feet
Ending Storage (12-31-20)	38,663 acre-feet
Change-in-Storage	-3,927 acre-feet

In 2020, the volume of water in Big Bear Lake decreased by 3,927 acre-feet. The following subsections of this chapter describe each of the components in this water balance.

Lake Levels and Storage

Water levels in Big Bear Lake are measured continuously based on a reference mark located on the upstream side of the dam. In July 1998, Big Bear MWD completed installation of a continuous lake level recorder. The lake level recorder is a Global Water Model WL300 and is enclosed in a stilling well, which is attached to the upstream face of the dam. Lake level data is continuously transmitted by a remote telemetry unit (RTU) in the control building at the dam. From there, data is transmitted via radio to a central computer in the administrative offices of Big Bear MWD. The

automatically recorded values have been used since July 1998. The recorder can only record lake levels when the lake is within 15 feet of the top of the dam (i.e. above a gauge height of 57.33 feet). In 2020, the lake was within the top 15 feet all year. As a result, Big Bear MWD had recorded values for all of 2020.

The lake began the year at a gauge height of 60.89 feet and ended the year at a gauge height of 59.19 feet. Over the year, the lake level dropped 1.70 feet. The lowest recorded lake level was 59.11 feet or 13.14 feet below the top of the dam, and it occurred on December 27, 2020. The highest recorded lake level was 62.84 feet, which occurred on May 4, 2020. The lake is full at a gauge height reading of 72.33 feet (6,743.20 feet above msl) and is empty at a gauge height of zero.

The Watermaster uses an established gauge height-lake capacity table to estimate the volume of water in the lake from the measured gauge heights. At the beginning of the year, the lake contained 42,590 acre-feet of water. At the end of the year, there were 38,663 acre-feet of water in the lake. The lake content decreased by 3,927 acre-feet during 2020. When full, the lake contains 73,320 acre-feet of water.

Lake Evaporation

The Watermaster calculates evaporation from the lake surface using the Blaney Criddle formula to estimate monthly evaporation rates. The 1977 Annual Watermaster report describes the formula as follows:

“The Blaney Criddle empirical formula, utilizing average temperatures and daylight hours, has been used. The constant K for each month was calculated based on float pan empirical data at Long Valley Reservoir in Mono County, California, which is at elevation 6,796 feet, compared to the elevation of Big Bear Lake which is 6,743 feet.”

Monthly lake evaporation is calculated using the estimated evaporation rate and the average surface area of the lake during the month. If a negative value for lake inflow is calculated, the monthly evaporation rate is increased to achieve a zero lake inflow. Calculated negative lake

inflows occurred three times in 2020. They occurred in June, July, and October. The adjusted monthly evaporation rates totaled 4.461 feet (53.5 inches) for 2020. Total evaporation from the lake for 2020 was calculated to be 10,608 acre-feet.

Precipitation

Precipitation in the Big Bear Lake watershed varies significantly from Bear Valley Dam to Big Bear City at the east end of the watershed. **Table III-1** shows the monthly precipitation at Bear Valley Dam and the Big Bear City Community Services District for 2020. 2020 precipitation at the two stations was 21.50 and 11.43 inches, respectively. May, June, July, September, and October were the driest months with no precipitation. March and April were the wettest months with approximately 66 percent of the annual precipitation.

Table III-1 also compares the 2020 precipitation at the two stations with their corresponding averages for the forty-four years since the Judgment was rendered. At the Bear Valley Dam station, precipitation was 62 percent of its forty-four-year average, and at the Big Bear City Community Services District station, precipitation was 79 percent of its forty-four-year average. For both stations, 2020 precipitation averaged 67 percent of their forty-four-year combined average.

Table III-2 shows the annual precipitation for both stations for the forty-four years since the Judgment was rendered. As shown in **Table III-2**, 2020 was a below average year for precipitation. For the Bear Valley Dam station, precipitation was 61 percent of the 111-year (1910–2020) average of 35.00 inches.

Lake Inflow

Inflows to Big Bear Lake are not measured. Consequently, inflows naturally tributary to Big Bear Lake above Bear Valley Dam are calculated for each month using a water balance on the actual operation of the lake. This calculation, which utilizes observed basic data along with the calculated evaporation losses described previously, creates a water balance for each month to determine the amount of natural flow into the lake. The formula used is:

Updated 2/07/21 - D. Evenson

$$\text{Inflow} = \text{Evaporation} + \text{Releases} + \text{Spills} + \text{Leakage} + \\ \text{Net Withdrawals} - \text{Change in Storage}$$

If the calculated monthly inflow is a negative value, it is reset to zero, and the monthly evaporation rate is recalculated to achieve a lake water balance. Calculated negative lake inflows occurred three times in 2020. They occurred in June, July, and October.

Total annual inflow for 2020 into the lake was calculated to be 7,945 acre-feet. The largest monthly inflow was 3,894 acre-feet, and it occurred in April. The average annual lake inflow for the 44 years (1977-2020) since the Judgment was rendered is 15,049 acre-feet. The median annual inflow for this same period is 9,355 acre-feet.

Table III-3 lists the annual lake inflows for the period 1977–2020. This table also ranks the inflows from the lowest (1,717 acre-feet in 2002) to the highest (48,613 acre-feet in 1993). Inflow to the lake for 2020 was well below both the average inflow and the median inflow for the forty-four years since the Judgment was rendered in 1977. Fifteen years had lower lake inflows, and twenty-eight years had higher lake inflows.

SWRCB Order No. 95-4

On February 16, 1995, the State Water Resources Control Board (SWRCB) issued Order No. 95-4. This order directed the Big Bear MWD and Bear Valley Mutual Water Company to release enough water from the lake to maintain a minimum seven-day average flow of 1.2 cfs and a minimum average daily flow of 1.0 cfs in Bear Creek no more than 500 feet downstream of its confluence with West Cub Creek. This location is referred to as Station A. In 1998, Big Bear MWD completed construction of a continuous flow recording device at Station A to measure compliance with SWRCB Order No 95-4.

SWRCB Order No. 95-4 also required sufficient releases to maintain a minimum flow of 0.3 cfs at a location approximately 300 feet downstream from the toe of the dam. This location is referred to as Station B. In 1998, Big Bear MWD also completed construction of a continuous recording device at this location to measure compliance with SWRCB Order No. 95-4.

Table III - 3

2020	7,945		Max	44	97.8%	1993	48,613
1977 - 2020							
Maximum	48,613						
Average	15,049						
Median	9,355						
Minimum	1,717						

Notes: 1980 and 1983 values were corrected to delete non-tributary inflows to the Lake
 1998 inflows were corrected to reflect actual value in the 1998 Annual Report

Station B History

Flow at Station B was initially measured by a compound weir with a v-notch section and a rectangular section. It was attached to a reinforced concrete structure in the riverbed. The v-notch section had a flow range of 0 to 0.44 cfs and the rectangular section had a flow range of 0.44 to 5.03 cfs. A water level transmitter is located in a stilling well just upstream of the weir structure. The water level data are transmitted to a remote telemetry unit (RTU) located in the control building at the dam. From there, data are transmitted to a central computer at the administrative offices of Big Bear MWD where average daily flow rates at Station B were calculated based on the rating curve of the weir plate.

In late 2015, vandalism at Station B impaired the reliability and accuracy of the flow measurements at Station B. To confirm compliance with the SWRCB Order No. 95-4, Big Bear MWD used the measured flows from the 6-inch Bypass Pipeline plus the estimated leakage from the sluice gates until Station B was repaired.

In October 2016, the Station B weir plate was replaced to improve the accuracy of the water level measurements and the calculated flow values. The weir plate was changed from the compound weir to a 90-degree, 12-inch v-notch weir. Big Bear MWD reprogrammed the SCADA/PLC for the new weir and the flow values at Station B showed improved accuracy.

However, in 2017 measurement problems at Station B continued so Big Bear MWD continued to rely on using releases from the 6-inch Bypass Pipe Line to maintain flows at Station B. Big Bear MWD contracted with XiO, Inc. to install a new transducer probe and cloud SCADA system to record flows through the new weir plate at Station B. The new system was expected to be operational in early 2018 but problems with the data transmission cable delayed implementation. On December 12, 2018, the cable was repaired and the Station B data collection became operational and worked throughout 2020.

Station A History

On December 29, 2004, data transmission from Station A ceased. In January of 2005, major storms hit the Bear Creek watershed with significant snowfall. Consequently, Big Bear MWD staff could

not access Station A until May. On their first visit to the site, they found the data transmission facilities destroyed, the stilling basin filled with sediment and the weir plate damaged. The staff estimated the flow in Bear Creek at this time to be in the range of 10 to 15 cfs, well above the 1.20 cfs requirement.

Beginning in June 2005, the staff visited the site every two weeks and made velocity and water depth measurements. From these measurements, they used two methods to estimate the flow at Station A. Flow estimates ranged between 11.8 cfs and 2.3 cfs. Consequently, in 2005 Station A was well in compliance with the 1.20 cfs, seven-day flow requirement.

During the summer and fall of 2005, Big Bear MWD repaired the weir plate, cleaned out the stilling basin, and installed a battery operated, pressure transducer to record weir water depth information. Since 2005, when weather conditions permit, Big Bear MWD retrieves the recorded information and calculates the flows at Station A.

In December 2010, major storms again hit the Bear Creek watershed, destroyed the data recording equipment and filled the stilling basin with sediment and rock at Station A. In November 2011, Big Bear MWD cleaned out the stilling basin and downstream creek bed and installed a new battery operated, pressure transducer to record weir water depth information. However, there was some damage to the weir plate that could not be repaired.

When weather conditions permit, Big Bear MWD staff retrieves the recorded information, which again allows the flow at Station A to be calculated.

To determine if Station A was determining flows accurately, Big Bear MWD retained a consultant, Jericho Systems, Inc., to manually measure the Bear Creek flows above and below Station A on two occasions. The consultant found that the measured flows were 0.5 to 1.0 cfs higher than the flows calculated from water level data applied to the damaged weir plate. In 2017, Big Bear MWD began discussing options for Station A with the State Water Resources Control Board. These discussions will continue in 2021.

Flow Compliance Plans

During 2005, Big Bear MWD, working with State Water Resources Control Board (SWRCB) and the State Department of Fish and Game, developed a proposed plan to keep Station A in compliance with both the 1.0 cfs average daily flow requirement and the 1.2 cfs seven-day average flow requirement. This proposed plan involved increasing the Station B flow requirements to insure the Station A requirements would be met. The new Station B requirements vary by month and hydrologic year type. The monthly hydrologic year type is based on water year-to-date precipitation at Bear Valley Dam. Water years (October 1 to September 30) are used to determine the hydrologic year type. The adopted plan is referred to as the “Exhibit A Flow Compliance Plan” and is presented in the following table.

Exhibit A Flow Compliance Plan
Table to Determine Minimum Daily Flows at Station B
Based Upon Water Year-to-Date Precipitation at Bear Valley Dam

Date	Enter Water Year-to-date Precipitation at Bear Valley Dam (inches)	Dry Year		Below Normal Year		Above Normal Year		Wet Year	
		If year-to-date precipitation is less than (inches)	Station B Minimum Flow is (cfs)	If year-to-date precipitation is between (inches)	Station B Minimum Flow is (cfs)	If year-to-date precipitation is between (inches)	Station B Minimum Flow is (cfs)	If year-to-date precipitation is more than (inches)	Station B Minimum Flow is (cfs)
October 1		n.a.	0.95	n.a.	0.95	n.a.	0.95	n.a.	0.95
November 1		0.03	0.90	0.03 and 0.56	0.90	0.57 and 1.93	0.70	1.93	0.70
December 1		1.59	0.85	1.59 and 3.04	0.85	3.05 and 5.60	0.80	5.60	0.60
January 1		3.73	0.90	3.73 and 8.14	0.75	8.15 and 12.84	0.75	12.84	0.30
February 1		8.94	1.00	8.94 and 13.84	0.85	13.85 and 20.79	0.50	20.79	0.30
March 1		14.42	0.80	14.42 and 20.05	0.40	20.06 and 31.47	0.40	31.47	0.30
April 1		19.29	0.75	19.29 and 25.84	0.50	25.85 and 40.30	0.40	40.30	0.30
May 1		21.61	0.95	21.61 and 28.65	0.70	28.66 and 41.16	0.55	41.16	0.30
June 1		22.18	1.15	22.18 and 30.01	0.80	30.02 and 41.86	0.75	41.86	0.30
July 1		22.42	1.20	22.42 and 30.01	0.95	30.02 and 41.86	0.95	41.86	0.30
August 1		22.93	1.25	22.93 and 30.69	1.05	30.70 and 42.48	0.95	42.48	0.30
September 1		23.30	1.00	23.30 and 30.86	0.95	30.87 and 43.69	0.95	43.69	0.30

The plan was approved by the SWRCB on January 08, 2009. The amended order also required Big Bear MWD to monitor the flows at Station A for ten years to confirm that the Exhibit A Flow Compliance Plan would satisfy the minimum flow requirements at Station A. Starting in December of 2005, Big Bear MWD followed the Exhibit A Flow Compliance Plan for Station B.

Effective July 1, 2014, Big Bear MWD adopted a “Revised Flow Compliance Plan” that increased the minimum flow requirements at Station B in some months based on their experience over the six years since the SWRCB approved the Exhibit A Flow Compliance Plan. The Revised Flow Compliance Plan is shown on the following table. The Revised Station B flow requirements for 2020 are highlighted in yellow.

**2020 Revised Flow Compliance Plan
Table to Determine Minimum Flows at Station B
Based Upon Year-to-Date Precipitation at Bear Valley Dam**

Date	Water Year-to-date Precipitation at Bear Valley Dam (inches)	Dry Year		Below Normal Year		Above Normal Year		Wet Year	
		If year-to-date precipitation is less than (inches)	Station B Minimum Flow is (cfs)	If year-to-date precipitation is between (inches)	Station B Minimum Flow is (cfs)	If year-to-date precipitation is between (inches)	Station B Minimum Flow is (cfs)	If year-to-date precipitation is more than (inches)	Station B Minimum Flow is (cfs)

Note 1

Note 2

Yellow highlighted values are the Flow Compliance values for CY 2020

Minimum flow values in blue are revised values used effective July 1, 2014

Based on the Revised Flow Compliance Plan and the actual water year-to-date precipitation at Bear Valley Dam, the plan for minimum daily average flows at Station B in 2020 were as follows:

Month 2020	Hydrologic Condition WY To-Date	Minimum Daily Average Flow (cfs)	Exhibit A Req.
January	Wet	0.85	0.30
February	Above Normal	0.50	0.50
March	Below Normal	0.85	0.40
April	Below Normal	0.50	0.50
May	Above Normal	0.55	0.55
June	Above Normal	0.75	0.75
July	Above Normal	0.95	0.95
August	Below Normal	1.50	1.05
September	Below Normal	1.20	0.95
October	Start Water Year	1.20	0.95
November	Dry	1.10	0.90
December	Above Normal	0.85	0.80

Flows at Station B normally consist of leakage from the dam and spillway gates, releases and leakage from the outlet works, spills from the lake, and inflows and consumptive losses between the Dam and Station B.

In December 2018, the XiO cloud SCADA system was installed and began collecting data. There was a testing period between December 2018 and January 2019 to ensure data collection reliability and probe accuracy. In 2019, the XiO data was checked against the original transducer at Station B to ensure accuracy of measurement and system redundancy. With reliable data from Station B, the XiO system will automatically actuate the 6-inch bypass valve based on flow conditions at Station B. If side flows are excessive, the XiO system will slow the flow of the 6-inch bypass valve. On the contrary, if side flows are non-existent, the XiO system will adjust flows through the 6-inch bypass valve to meet the desired downstream flow rate as stated in the Revised Flow Compliance Plan based on cumulative water year rainfall.

2019 was a year of learning how to implement the XiO Cloud SCADA system. The system began operation in December 2018 and on February 17, 2019, a deep freeze damaged the control valve on the 6-inch Bypass Line, which put the XiO system out of service. The control valve was

replaced but there were other operational and equipment issues that required the Big Bear MWD staff to manually oversee the control system to keep Station B in compliance. On December 2, 2019 all problems with XiO SCADA system appeared to be resolved.

During 2020, the Exhibit A Flow Compliance Plan requirements at Station B were met on all days. The Revised Flow Compliance Plan flow requirements at Station B were higher in some months and the number of days of non-compliance in 2020 was 6 days. On these days there were operational issues that resulted in flows that were a little below the requirements. Meeting the Flow Compliance requirements at Station B kept the flows at Station A in compliance with the SWRCB requirements.

The next step for Big Bear MWD is to review the flow and release data collected over the past 13 years and recommend a final Flow Compliance Plan for Station B to the SWRCB that will require flows at Station B that will meet the flow needs at Station A and to eliminate the flow measurement facility at Station A. In 2021, Big Bear MWD will be in discussions with the SWRCB to amend SWRCB Order No. 95-4 to make this change.

Watermaster Accounting Procedures

To handle the SWRCB Order No 95-4 lake release and In Lieu delivery conditions, the Watermaster Committee, in 2002, clarified the accounting procedures. In 2003, the Watermaster made further improvements to these procedures. In 2005, they made a further change to better reflect actual lake management. This change was to include leakage with the flows from the outlet works in the accounting for flows to meet SWRCB Order 95-4. For the lake accounts, the accounting procedures are:

1. The outlet works flows and dam leakage will be deducted from both Mutual's and BBMWD's lake accounts in proportion to the amount of water in their respective lake accounts on days when Mutual is not fully utilizing all the flow in the Santa Ana River at the point of diversion to the forebay of SCE Power Plant No. 1.
2. The outlet works flows and dam leakage releases will be deducted entirely from Mutual's lake account on days when:

- a) Mutual is fully utilizing all the flow in the Santa Ana River at the point of diversion to the forebay of SCE Power Plant No. 1,
- b) Mutual is requesting releases from the lake and BBMWD is releasing water from the lake or providing In Lieu supplies, or
- c) Mutual is purchasing SWP Water.

Prior to 2012, the term “fully utilized” was defined as days when the “net amount” of water the SBVWCD diverted from the forebay of SCE Power Plant No. 3 was less than the amount of the fish release. The “net amount” of water diverted from the forebay was defined as the actual amount diverted by SBVWCD for groundwater recharge less the amount of water delivered to the forebay by the Bear Valley Pick-up on the Santa Ana River below Seven Oaks Dam. In prior years, the Committee noticed there were some operational conditions when this definition did not accurately depict if Mutual was “fully utilizing” all the flow in the Santa Ana River at the point of diversion to the forebay of SCE Power Plant No. 1. When this occurred, adjustments were made in the accounting to better reflect actual operating conditions.

In 2012, the Committee reviewed the conditions and adopted a revised definition of the term “fully utilized.” The revised definition of when Mutual is “fully utilizing” all the flow in the Santa Ana River is when:

- Mutual’s Deliveries of Santa Ana River water are greater than or equal to the SCE Santa Ana River Diversions, and
- The SCE Santa Ana River Diversions are greater than the Outlet Works Flows and Dam Leakage used to meet SWRCB Order No. 95-4.

The daily values of Mutual’s Deliveries and the SCE Santa Ana River Diversions will be made using the Daily Flow Reports prepared by the San Bernardino Valley Water Conservation District.

The daily SCE Santa Ana River Diversions will be determined as the sum of the following flows:

- PH#3 Penstock (CALC) (A1) flow,
- BVMWC Highline (B1) flow,
- Greenspot Spill (F1) to PH#3, and
- Deliveries to the Greenspot Pipeline (C1).

Beginning in 2018, the Watermaster Committee decided that Mutual’s Deliveries of Santa Ana River Water should be determined as the sum of the following three deliveries:

- BVMWC Highline (B1)* delivery,
- Northfork delivery: Northfork Canal Weir delivery (G2) plus Edwards Canal delivery (H2) plus Northfork Parshall Flume delivery to SBVWCD (K2), and
- Redlands delivery: Redlands Aqueduct Weir (W1) delivery less the Redlands Tunnel (I1) inflow plus the Redlands Sandbox Spills (YI).

The daily Outlet Works Flows and Dam Leakage from Big Bear Lake used to meet SWRCB Order No. 95-4 are determined by the Watermaster Committee using measured releases and leakage estimates provided by Big Bear MWD.

The following paragraphs in this section describe the 2020 accounting changes related to the Big Bear Lake outflows for fishery protection required by SWRCB Order 95-4 to reflect the operational change of SCE operations and the impact of related SOD operational procedures in 2020.

2020 was an abnormal operational year that required changes to the accounting procedures used to allocate the daily Outlet Works Flows and Dam Leakage for fishery protection required by SWRCB Order 95-4. Beginning March 3 and throughout the remainder of 2020, SCE was not generating power. The only diversions SCE made at their Bear Creek diversion facility were for delivery to Mutual at the Greenspot Forebay. The diversions during this period were between zero and 11 cfs. This SCE operation limited the amount of SAR water that could be delivered to Mutual. Because of the low diversion rates, the assumption was made that SCE did not divert the full flow of Bear Creek and the Outlet Works Flows and Dam Leakage would continue to flow downstream into Seven Oaks Reservoir. The Watermaster Committee is trying to get information from SCE to confirm this assumption.

The updated allocation for the condition when SCE is not operational is to determine if Mutual is “fully utilizing” the releases from Seven Oaks Dam. If they are “fully utilizing” the SOD releases the amount of the Outlet Works Flows and Dam Leakage would be deducted from Mutual’s Lake Account. “Fully utilizing” is defined as the condition when Mutual is diverting essentially all of the SOD releases and the amount diverted by SBVWCD and/or flowing past Cuttle Weir is less than the amount of the Outlet Works Flows and Dam Leakage, or if Mutual is also taking delivery of In Lieu Water. In 2020, these conditions occurred between May 25 and December 31, and Mutual was considered to be “fully utilizing” the SOD Releases.

*The term in parenthesis refers to the site location used in the Daily Flow Reports (DFR’s) of the San Bernardino Valley Water Conservation District.

When the SOD releases are high and the SBVWCD is diverting the SOD releases for recharge or there are undiverted releases flowing past Cuttle Weir, the amount of the Outlet Works Flows and Dam Leakage is deducted from Mutual's and BBMWD's lake accounts in proportion to the amount of water in their accounts. In 2020, this condition occurred between March 24 and May 24, and Mutual was considered to be NOT "fully utilizing" the SOD releases.

A second change was adopted to reflect the additional condition when the SOD operations are not allowing enough releases to meet Mutual's needs and Mutual must purchase SWP Water from Valley District. Under these conditions, Mutual could not receive In Lieu Water because Lake Releases could not be delivered to Mutual with SCE not in operation and SOD not releasing enough water. The accounting change was to not deduct the Outlet Works Flows and Dam Leakage from Mutual's account on days they purchased SWP Water and SCE was not in operation and SOD was not releasing enough water to meet their needs. The amounts would be deducted from Mutual's and BBMWD's lake accounts in proportion to the amount of water in their accounts. In 2020, this condition occurred between March 3 and March 23.

In 2020 the estimated Outlet Works Flows and Dam Leakage was 671.4 acre-feet and using the update accounting procedures resulted in the following allocation:

1. 83.6 acre-feet was deducted from both Mutual's and BBMWD's lake accounts in proportion to the amount of water in their respective lake accounts on the 93 days when Mutual did not "fully utilize" the Santa Ana River Diversions or the SOD releases when SCE was not operational and did not receive In Lieu deliveries or purchase SWP water when SCE was operational (January 1 to March 2), and
2. 587.8 acre-feet was deducted from Mutual's lake account on the 273 days they "fully utilized" the Santa Ana River Diversions or the SOD releases when SCE was not operational, received In Lieu water deliveries or purchased SWP water when SCE was operational (January 1 to March 2).

The Watermaster Committee will continue to review these accounting methods in 2021 to make sure the determinations of the allocation of the "Outlet Works Flows and Dam Leakage" for fishery protection in Bear Creek accurately reflect actual operations.

The input data and allocation of releases under SWRCB Order No. 95-4 in **Table 2.C of Appendix B** reflect the above revised procedures.

For the Basin Make-up Account, the accounting procedures are:

1. Under a Big Bear MWD operation, the actual fish releases used by Mutual under Item 2 above will be considered a “release actually made under District Operation (R_d)” and the actual releases under Item 1 above will be treated as “spills which actually occurred under District Operation (S_d)”.
2. Under a Mutual operation, the fish releases used by Mutual under Item 2 above will be considered a “release which would have been made under a Mutual Operation (R_m)”, and the releases allocated to Mutual under Item 1 above will be considered a “spill which would have occurred under a Mutual Operation (S_m).”

Tables 4.A and 4.B of Appendix B reflect these accounting procedures.

The Watermaster Committee will continue to work on these accounting procedures in 2021 to make sure they will be accurate for all possible river flow and diversion conditions that could occur in future years.

Dam and Spillway Gate Leakage

Leakage through the spillway gates in Bays 1 and 10 can occur when the lake level is above the spillway crest elevation. In addition, minor leakage from pressure relief valves in Bays 1 and 10 can occur when the lake level is below the spillway crest and above the elevation of the relief valves. The structural reinforcement project completed in 2006 eliminated the dam leakage from cracks in the upper arches of Bays 5, 6 and 8.

In 2020, the lake level was below the spillway crest (Elevation 6,735.25 feet which is 8.00 feet below a full lake) the full year and no spillway gate leakage was observed. The lake level was above the relief valve elevation (6,731.05 feet above MSL) from January through the middle of November in 2020 and Big Bear MWD observed relief valve leakage during this period. The 2020 estimated monthly leakages are shown in **Table III-4**. The total estimated leakage from Bays 1 and 10 for 2020 was 2.2 acre-feet.

In late November 2009 during excavation of foundations for the new highway bridge below the Dam, workers noticed water entering the excavation and seeping to the surface below. During meetings with Caltrans engineers and the District's engineer in January 2010, Caltrans indicated

they were convinced the new seepage was not related to their blasting efforts but the result of the removal of overburden and bedrock resulting in the opening of new pathways for seepage water to move through the abutment rock. Caltrans promised to prepare a remedial grouting plan and submit it to the District for engineering review and approval.

TABLE III-4
ESTIMATES OF
MONTHLY DAM LEAKAGE
 (acre-feet)
 Calendar Year 2020
 Big Bear Watermaster

Month	Spillway Gate Leakage (AF)	Bay 1 and Bay 10 Relief Valve Leakage (AF)	Additional Foundation Leakage (AF)	Total Estimated Leakage (AF)
January	-0-	0.17	-0-	0.17

August	-0-	0.14	-0-	0.14
September	-0-	0.11	-0-	0.11
October	-0-	0.14	-0-	0.14
November	-0-	0.04	-0-	0.04
December	<u>-0-</u>	<u>-0-</u>	<u>-0-</u>	<u>-0-</u>
Annual Total	-0-	2.21	-0-	2.21

In late 2011, Caltrans prepared a remedial grouting program to control seepage at the left abutment of the dam. After review and approval by the Big Bear MWD, the program was submitted for technical review to the Division of Safety of Dams, and Caltrans received their approval in concept. The Caltrans proposal included four rows of grout holes. Two parallel rows parallel to the edge of the lake beginning at the left abutment and two rows perpendicular to the first rows beginning at the left abutment. While the intent of Caltrans is to protect their new highway bridge foundation, the project should dramatically reduce seepage at the left abutment of the dam. In mid-2012, Caltrans conducted the left abutment grouting on the roadbed approach (now the parking area) of the old highway bridge. Two rows of holes were drilled and grouted during the process along with three verification holes. After completion of this effort in August 2012 observed downstream seepage at the left dam abutment was significantly reduced. As a result of this observation Caltrans determined that the second set of grout holes would be unnecessary and Caltrans closed the project.

The additional foundation leakage cannot be directly measured and has been estimated from flow measurements at Station B that are in excess of the measured releases and estimated spillway gate leakage from the lake. Beginning in September 2013, no additional foundation leakage has been identified which indicates the grouting program may have reduced or perhaps eliminated the foundation leakage. The Committee will continue to monitor this source of leakage before drawing any conclusions concerning the effectiveness of the grouting program.

The total estimated dam leakage in 2020 was 2.2 acre feet and it contributed to the outflows from the Lake to meet the requirements of SWRCB Order 95-4. The dam leakage was from Bay 1 and Bay 10 of the multi- arch Bear Valley Dam. This “leakage,” as shown in column two of **Table III-4**, is not directly from the spillway gates in Bays 1 and 10, but rather from the pressure relief pipes located below the spillway gates in Bays 1 and 10. When the lake level is below the bottom of the spillway gates (<6,735.25 feet above sea level NGVD29) there is still the potential of water leakage through these pressure relief pipes. These pressure relief pipes rarely flow more than one gallon per minute and this leakage amount should be considered separate from spillway gate leakage.

Outlet Works Releases

Water is released from the lake through the outlet works. These releases can be for flood control purposes, for Mutual, or for fishery protection in accordance with SWRCB Order No. 95-4.

Releases are made either through a 36-inch outlet works or a 6-inch bypass pipeline that is connected to the 36-inch outlet works. A 36-inch butterfly valve is the primary control mechanism on the outlet works. Flows in the outlet works are measured by an in-line 36-inch flow meter that was installed on the outlet piping downstream of the butterfly valve in December 1993 to replace an older meter. The meter is an Electromatic Flow Meter Model 655 manufactured by Sparling Instruments, Inc. Downstream of the flow meter, the outlet works splits into a 24-inch pipeline and a 14-inch pipeline. Flows through these two pipelines are controlled by two motorized sluice gates. The two sluice gates are 24-inch by 24-inch and 14-inch by 14-inch. The 36-inch meter was calibrated with an accuracy of ± 0.5 percent between 7.07 and 212 cfs. When the sluice gates were fully opened and the lake was full, the meter measured a flow of 256 cfs, which is the maximum that can be discharged through the outlet works. When the lake is full and only the 14-inch sluice gate is open, the flow from the outlet works is estimated to be 68 cfs. When only the 24-inch sluice gate is open, the maximum discharge from the Outlet Works is estimated to be 195 cfs. The rate of flow and totalized flow are recorded at the flow meter and also at the control building. There is usually a small amount of leakage through the two sluice gates. However, in 2020, the Sluice Gates were opened to provide additional Lake releases to supplement the flow from the 6-inch Bypass Line. The releases between June 5 and August 5 ranged between 0.56 and 0.70 cfs. These increases were needed to make sure the flow compliance requirements at Station B were met. This condition resulted in outflows from the Sluice Gates to be higher than the normal leakage amounts. In 2020, the flow from the sluice gates was estimated to be 101.0 acre-feet.

There is also a 3-inch Relief Line, meter and valve on the 36-inch outlet pipeline. During the winter months this valve is usually opened to allow a small amount of flow (usually 4 to 6 gpm) to pass through the 36-inch pipeline and prevent water in the pipeline from freezing. The 3-inch Relief Line had been used to provide water for the construction of the new highway bridge downstream of the Dam that replaced the bridge that was on the top of Bear Valley Dam. The bridge construction was completed in November 2011, and Big Bear MWD is no longer releasing any water for the bridge construction project. The releases through the 3-inch Relief Line were 24.1

acre-feet in 2020, and they flowed down Bear Creek and were measured as part of the flow at Station B. These releases are considered as part of the releases to comply with SWRCB Order N0. 95-4.

Flow through the 6-inch Bypass Pipeline was metered beginning in August 2006 when Big Bear MWD replaced a 4-inch Bypass Pipeline with a 6-inch Bypass Pipeline, valve and a Krohne IFS 400 flow meter. Releases to comply with SWCRB Order No. 95-4 are normally made through the 6-inch Bypass Pipeline. The total amount released through the 6-inch Bypass Pipeline in 2020 was 544.1 acre-feet.

In 2020, Big Bear MWD released water from the lake through the Outlet Works to comply with SWRCB Order No. 95-4. **Table III-5** summarizes the monthly amounts of water discharged from the outlet works in 2020. The total from the Outlet Works in 2020 was estimated to be 671.4 acre-feet.

* These releases were also used to partially or wholly meet Mutual's needs for lake water.

Mutual Releases

There were no lake releases for Mutual in 2020.

San Bernardino Valley MWD Releases

In 2020 San Bernardino Valley MWD did not request any lake releases from their storage account in Big Bear Lake for delivery of Lake In Lieu Water to Mutual.

Flood Control Releases

There were no flood control releases in 2020.

Spills

Spills are flows that leave the lake over the spillway of the dam. They are calculated from lake gauge height readings and spillway gate settings at the dam during the time of the spill. In 2020, there were no spills from the lake

Station B Flows

Leakage estimates and outlet works flows are confirmed by comparing the sum of dam leakage plus the amount released from the lake through the outlet works with the flow measured at Station B, which is 300 feet downstream of the dam. The differences can be either gains or losses. Although small, these differences can illustrate the impacts of rainfall/snowfall and plant evapotranspiration between the dam and Station B. **Table III-6** shows this comparison.

TABLE III-6
COMPARISON OF FLOWS AT STATION B WITH
ESTIMATED LEAKAGE AND FLOWS FROM OUTLET WORKS
 Calendar Year 2020 - Big Bear Watermaster

Month	Flows from Outlet Works (AF)	Dam Leakage (AF)	Spillway Gate Release (AF)	Total Flows From Lake (AF)	Flow at Station B (AF)	Gains/ (Losses) (AF)
January	49.2	0.2	-	49.4	48.4	(1.0)

October	81.4	0.1	-	81.5	77.9	(3.7)
November	71.5	0.0	-	71.5	68.4	(3.1)
December	57.2	-	-	57.2	57.9	0.7
Total	669.2	2.2	-	671.4	727.2	55.8

In 2020, the measured and estimated flow at Station B was 55.8 acre-feet more than the estimated amount leaving Big Bear Lake from releases, leakage and spills. In 2020 these differences reflect the side flows that enter Bear Creek between the Dam and Station B during the winter months. In the summer and fall months, the differences were small and reflect the improved measurements at Station B. In October 2016, Big Bear MWD replaced the weir plate at Station B with a 12-inch v-notch weir to improve the accuracy of the measurements and replaced the communication line between the transducer and the SCADA system. These changes improved the accuracy of the Station B measurements. Big Bear MWD is continuing their efforts to improve the reliability and accuracy of the Station B measurements by installing an additional transducer probe and XiO cloud SCADA system. The Watermaster Committee will continue to monitor this condition in 2021.

Lake Withdrawals for Snowmaking

Big Bear MWD sells water from Big Bear Lake for use in snowmaking, fire protection and re-vegetation for ski areas within the watershed. In 2020, 1,017.8 acre-feet of water was withdrawn from the lake for these purposes. The withdrawals for snowmaking occurred in seven winter months (January, February, March, April, October, November and December). The withdrawals for fire protection and re-vegetation occurred in five summer and fall months (May, June, July, August and September).

Big Bear MWD began selling water from the lake for snowmaking purposes in 1980 and the Watermaster accounting assumed 50 percent would return to the lake as snowmelt. In 1989, Big Bear MWD retained James M. Montgomery, Consulting Engineers to evaluate this assumption. Their report was completed in May 1989 and concluded the return flow factors would range between 0.48 and 0.52 depending on the air temperature during snowmaking. The report recommended the Watermaster continue using a return flow factor of 0.50. The Watermaster Committee adopted the recommendation in 1989.

Based on this report, Watermaster estimates that half of the monthly amount pumped from the lake for snowmaking in the winter months returns to the lake in the form of snowmelt during the same month. In 2020, the withdrawal from the lake for snowmaking was 850.2 acre-feet and 425.1 acre-

feet returned to the lake. In the summer and fall months, 167.6 acre-feet of water was used and none was returned to the lake. The “net withdrawal” for all purposes was 592.7 acre-feet.

Net Wastewater Exports

The Watermaster Committee calculates “net” wastewater exports as the difference between the wastewater that leaves the Big Bear Lake Watershed and the water supply that is imported into the Big Bear Lake Watershed from the Baldwin Lake Watershed. The methodology used to make these calculations is documented in a report entitled “Development of a Methodology for Estimating Gross Sewage Export from Upper Bear Creek Watershed”, prepared by James M. Montgomery, Consulting Engineers, Inc., in September 1989 for Big Bear Municipal Water District.

Wastewater is exported from the Big Bear Lake watershed to the Baldwin Lake watershed from the following three areas:

- City of Big Bear Lake
- San Bernardino County Service Area 53B
- Airport area served by Big Bear City CSD

Wastewater flows from the first two areas are measured by the Big Bear Area Regional Wastewater Authority (BBARWA). Wastewater flows from the airport area within the Big Bear Lake watershed are estimated based upon the number of sewer connections in the area.

Water is imported into the Big Bear Lake watershed from the Baldwin Lake watershed by the following three activities:

- City of Big Bear Lake imports groundwater from the Baldwin Lake watershed.
- Big Bear City CSD provides water to the airport area from the Baldwin Lake watershed
- Big Bear City CSD occasionally provides emergency water to the City of Big Bear Lake

The City of Big Bear Lake imported supplies and emergency supplies are both metered, while the airport area supplies are estimated based on the number of water service connections.

In 2020, the "net" wastewater exported from the Big Bear Lake Watershed was 1,038.1 acre-feet. **Table III-7** contains the 2020 monthly net exports. The “net” wastewater exported in 2020 was lower than normal due to the dry winter conditions, which contributed to lower inflow/ infiltration into the sewerage collection systems from rainfall and snowmelt.

SANTA ANA RIVER

Bear Valley Mutual Water Company Water Needs

Mutual meets the water needs of its shareholders primarily by diverting water from the Santa Ana River. When river flow is inadequate to meet their needs, Mutual can call upon water stored in Big Bear Lake, pump ground water from the San Bernardino ground water basin, buy State Water Project (SWP) water from San Bernardino Valley MWD, or reduce the delivery rate to its shareholders.

In 2020, Mutual reported they may need up to 6,500 acre-feet of water from Big Bear MWD including the portion of the SWRCB 95-4 Lake outflows they could beneficially use. 2020 was a difficult year for Mutual because SCE was out of service between March 3 and December 31 and was only able to deliver Santa Ana River water to Mutual to the Greenspot forebay during this period. Fortunately, Mutual was able to use the excess releases from Seven Oaks Dam to help meet their needs. Mutual met their overall 2020 water needs by releases from SOD, In Lieu Water supplies from Big Bear MWD, diversions from the Santa Ana River, SWP water purchases from Valley District and local groundwater. Mutual also got some water from the lake releases and dam leakage for fish protection in Bear Creek.

Summary of Flows and Diversions at Mouth of the Santa Ana River Canyon

Exhibit D, Section 1(f) of the Judgment calls for data to be included in each Watermaster annual report summarizing the river flows at the mouth of the Santa Ana River Canyon and diversions at the mouth of the Santa Ana River Canyon. Specifically, it requests quantities of water diverted into the following facilities:

1. Bear Valley High Line
2. Redlands Canal
3. North Fork Canal
4. Edwards Canal
5. San Bernardino Valley Water Conservation District Spreading Grounds

Exhibit D also requires the annual report to estimate the amount of Santa Ana River flow not diverted for beneficial use. **Table III-8** contains this information for 2020.

Flow of Santa Ana River at Mouth of Canyon

The United States Geological Survey (USGS) reports flow in the Santa Ana River at the mouth of the Santa Ana Canyon under Station No. 11051501. This station is the combination of flow records from three gauges (USGS Station No. 11049500, 11051499, and 11051502). Flow in the flume between the afterbay of SCE Power House No. 1 (SCE Power House No. 2 was removed due to the construction of Seven Oaks Dam) and the forebay of SCE Power House No. 3 is estimated by the USGS using a meter installed by SCE and reported as Station No. 11049500. Note that this metered flow includes the overflow from the old SCE Powerhouse No. 3 forebay as reported on the Daily Flow Report as the Greenspot Spill. In addition, the USGS maintains two gauging stations near the mouth of the Santa Ana River Canyon below Seven Oaks Dam. Station No. 11051499 measures the flow in the main river channel while Station No. 11051502 measures river flow diverted into the afterbay of SCE Power House No. 3 through the Bear Valley River Pick-up. The measured flows at this gauge also includes the over-flow from the old SCE Powerhouse No. 3 forebay. The records from these three sources are summarized, adjusted for the overflow from the old SCE Powerhouse No. 3 forebay, and reported as the total flow in the Santa Ana River, USGS Station No. 11051501.

During 2020, the total river flow reported by the USGS, currently provisional, was 35,287 acre-feet. However, measurements at Station No. 11049500 include the amount of groundwater pumped by Mutual and discharged into the flume above the gauge. Thus, to get the actual Santa Ana River Flow, the Canyon Well production must be deducted from the reported flows. In 2020, the Canyon Well production was 131 acre-feet. Thus, the resulting estimated Santa Ana River flow was 35,156 acre-feet in 2020. However, this value does not reflect the storage change in the reservoir behind Seven Oaks Dam. In 2020, an estimated 799 acre-feet of water was taken out of storage from behind the Dam. Thus, the estimated flow of the Santa Ana River at the mouth of the canyon above Seven Oaks Dam was 34,357 acre-feet in 2020.

Diversions by Bear Valley Mutual Water Company

Amounts diverted by Mutual and associated prior right companies are reported to the State Water Resources Control Board under Recordation Numbers 36-00021, 36-00022 and 36-00028. In 2020, Mutual's diversions were estimated to be 20,879 acre-feet based on the Daily Flow Reports

prepared by the San Bernardino Valley Water Conservation District (SBVWCD). The vast majority, 20,506 acre-feet, was water diverted from the Santa Ana River. Beginning in 2020, Mutual's diversions include the water they deliver to North Fork Water Company and North Fork delivers the water to SBVWCD via the North Fork Parshall Flume. Mutual also pumped 131 acre-feet of groundwater from their Canyon Well No.1 located in the Santa Ana Canyon above the major points of diversion, and they produced 242 acre-feet of water from the Redlands Tunnel.

Diversions by San Bernardino Valley Water Conservation District

Water diverted by the San Bernardino Valley Water Conservation District for groundwater recharge is by virtue of licenses, pre-1914 rights and diversion rights of San Bernardino Valley MWD and Western MWD; all diversions are reported to the State Water Resources Control Board. In 2020, the diversions were estimated to be 11,985 acre-feet of Santa Ana River water for ground water recharge based on the Daily Flow Reports prepared by the SBVWCD. As mentioned above, the SAR water SBVWCD received from the North Fork Parshall Flume was no included in Table III-8 as a SBVWCD diversion.

Amount Not Diverted

The sum of the diversions mentioned above are subtracted from the total river flow, as reported by USGS Gauge 11051501 plus the annual storage change in Seven Oaks Reservoir to determine the "Amount Not Diverted". The "Amount Not Diverted" represents the amount of water that flows past the mouth of the Santa Ana River Canyon without being diverted for beneficial use.

Losses and Measurement Errors

During preparation of the 1996 report, the Watermaster Committee discovered significant discrepancies between the value for "Amount Not Diverted", as calculated by the method contained in previous Watermaster Reports, and observed flows in the Santa Ana River just downstream from the last diversion point. Since 1994, San Bernardino Valley Water Conservation District staff have been estimating the amount of water flowing past the Greenspot Road Bridge at the Cuttle Weir, which is just downstream from the mouth of the Santa Ana River Canyon, on a daily basis. In past years the difference between the estimated flows at the Greenspot Road Bridge and the "Amount Not Diverted" were significantly different. The Watermaster has

conducted extensive research with regards to the discrepancy and provided the following eight explanations:

1. Leakage Losses between Inflows and Outflows. The first explanation was unmeasured losses between the points where inflows and outflows are measured. These include:

1. Leakage in the tailrace from SCE Power House No. 3 afterbay,
2. Leakage in the Redlands Aqueduct between SCE Power House No. 3 afterbay and the Redlands Sandbox, and
3. Leakage around the Redlands Sandbox weir.

2. Unmeasured Diversions. The second explanation was that Mutual can divert water for spreading at the Redlands Sandbox without it being measured. San Bernardino Valley Water Conservation District staff now observes and reports this diversion on a daily basis. These estimates are based on known flows delivered to the Redlands Sandbox and are fairly accurate. This possible source of error has been corrected and the amount diverted for spreading is included in Table III-8.

3. USGS Gauge Accuracy. The third possible explanation for the disparity is the accuracy of the USGS flow records. The USGS reports that this combined flow measurement of the three gaging stations is considered to have an accuracy rating of "fair". A "fair" rating means that 95 percent of the daily discharge measurements are within 15 percent of the true value. According to Jeffrey Agajanian of the USGS, this means the error band for the entire year should be within approximately 15 percent of the total measured flow. This value is a conservative estimate of the possible measurement errors and the flow is likely to be well within this error band, especially during the summer months when flows are generally constant and lower.

4. Water Delivery Flow Measuring Device Accuracy. A fourth reason for the difference could be inaccuracies in the diversion measuring devices, which should be less than +/- 10 percent at any given time. Most of these measurements are obtained through the use of stable, long-term weirs and parshall flumes, but small, though not insignificant, errors are possible. Some of the measurement devices provide daily readings and are equipped with totalizer equipment providing monthly data. The San Bernardino Valley Water Conservation District (SBVWCD) will continue to update totalizer equipment on any of the measurement devices that are not equipped with totalizer equipment.

5. Observed Flow at the Cuttle Weir. A fifth possible explanation was the accuracy of the flow estimates at the Cuttle Weir. These estimates are based on daily flow observations. Total

flow quantities are difficult to determine because of the high degree of short-term variability in the river flows during storm events. For 2020, the flow over the Cuttle Weir was estimated to be 205 acre-feet.

The construction of the Seven Oaks Dam required the reconstruction of the SCE flume between the old Power House No. 2 and No. 3. This eliminated any losses in the flume from the old Power House No. 2 and No. 3 and required the USGS to move Station No. 11049500 to the old forebay of Power House No. 3. Flow at this station was initially estimated by using the Daily Flow Report provided by the San Bernardino Valley Water Conservation District and is reported as Station No. 11049500. As of August 2001, SCE has installed a new meter in their aqueduct above the forebay of Power House No. 3 and data from this flow meter is provided to the USGS. In addition, improved efforts were taken to monitor diverted water at the Redlands Sandbox for ground water recharge and observed flows at the Cuttle Weir. The Watermaster has concluded that these efforts have reduced the losses and measurement inaccuracies such that the large errors that occurred in the past should no longer occur.

6. Storage behind Seven Oaks Dam. There is, however, an additional factor that must be considered when the Watermaster Committee estimates the “amount not diverted”. This factor is the amount of water that has been stored behind Seven Oaks Dam (SOD) and not released by year-end. This stored water is Santa Ana River flow that has not yet been measured by the two USGS stream gauges below the dam. In addition, water stored behind the dam from inflow in the previous year and released in the current year must also be taken into account. The amount stored behind SOD at the end of 2019 was 1,467.6 acre-feet (water surface elevation of 2,176.2 feet). The amount stored behind SOD at the end of 2020 was 668.6 acre-feet (water surface elevation of 2,160.0 feet). In other words, water was released from the dam that was stored from inflow in 2019. This amount was 799.0 acre-feet and was included in the USGS provisional value of 35,287 acre-feet. Deducting the amount of SAR water behind SOD in 2019 and released in 2020, and deducting the amount of groundwater pumped from BVMWC Canyon Well (-0- acre-feet) from the USGS provisional value decreases the estimate of Santa Ana River flow to 34,488 acre-feet for 2020.

7. Spills from SCE PH No. 3. In 2012, the Committee identified an additional location where Santa Ana River water that is not diverted is measured by the San Bernardino Valley Water Conservation District. This location is the afterbay of SCE Power House No. 3. On occasion, all of the water delivered to the afterbay is not diverted and some of it is spilled to a small channel

that discharges to the Santa Ana River below Cuttle Weir. The Committee agreed that these spills should be added to the observed flows at Cuttle Weir to estimate the “Estimated Flow Downstream of Diversions” as reported in **Table III-8**. In 2020, there were no spills from SCE PH No. 3.

8. Differences in Measurements. The USGS estimates of the Santa Ana River flow are based on stream gauges that record data at 15 minute intervals throughout the day. The estimates of diversions are based on the Daily Flow Reports prepared by the SBVWCD and these reports contain only a single value (usually in the morning) for each working day for each diversion point. Thus the diversion estimates are not as accurate as the USGS flow estimates and this could lead to significant errors in the “Estimated Not Diverted” value (2,460 acre-feet) as shown in Table III-8. The Watermaster Committee will review this item in 2021 to determine if Table III-8 should be revised to provide a better estimate of the amount of Santa Ana River water that is not diverted.

2020 Estimate of Amount Not Diverted

In 2020, San Bernardino Valley Water Conservation District observed 205 acre-feet of river flow past the Cuttle Weir at the Greenspot Road Bridge and no spills from the Santa Ana River from the afterbay of SCE Power House No. 3. Their estimate of these flows, which represents the amount not diverted, was 205 acre-feet.

In 2020, the estimated Santa Ana River flow at the mouth of the canyon was 34,488 acre-feet. The total estimated diversions of Santa Ana River flow by Mutual and San Bernardino Valley Water Conservation District was 32,622 acre-feet. After adding the 799 acre-feet of water stored behind Seven Oaks Dam in 2020, this left an estimated 2,665 acre-feet of Santa Ana River water not diverted in 2020. Comparing this difference with the observed flows past the Cuttle Weir at Greenspot Road Bridge (205 acre-feet) and the spills from the afterbay of SCE PH No. 3 (-0- acre-feet), results in unmeasured leakage losses and measurement errors of 2,460 acre-feet. These losses and errors represent 7.2 percent of the estimated Santa Ana River flow (acre-feet), which is higher than normal.

The main problem appears to be the estimates of flow at the Main River Gauge. The USGS annual flow estimate is 15,372 acre-feet, while the estimate from the DFR values is 12,052 acre-feet, a 3,320 acre-foot difference. The differences are mainly in April and May when there were high

releases from SOD. The Watermaster Committee will review this difference in 2021 to determine if any adjustments in diversions should be made to decrease the Amount Not Diverted.

Lake Releases/In Lieu Water Deliveries

Santa Ana River flows are often insufficient to meet Mutual's water needs; as a result, they frequently request lake releases from Big Bear MWD to meet their needs. Big Bear MWD has the choice of releasing water from the lake or providing an In Lieu supply. At their meeting on May 1, 1987, the Board of Directors of the Big Bear MWD voted unanimously to approve the following policy for providing In Lieu Water supplies.

1. *Adopt the following 1987 In Lieu policy:*
 - A. *When the lake is in the top 4 feet, the irrigation demands from the lake will be met by releasing water from Big Bear Lake.*
 - B. *When the lake is between 4 feet and 6 feet down, the District intends to purchase In Lieu Water between the months of May 1st and October 31st from either wells or the State Water Project; between November 1st and April 30, water required would be released from Big Bear Lake.*
 - C. *When the lake is between 6 and 7 feet down, the Board shall determine whether to release from the lake.*
 - D. *In the unlikely event that the lake is more than 7 feet down, the District intends to buy In Lieu water throughout the year.*
 - E. *The General Manager shall inform the Board each time water is released.*

On November 16, 2006, the Board of Directors of Big Bear MWD modified their Lake Release Policy to eliminate items C, D and E and to use In Lieu Water whenever the lake is more than 6 feet below full. The revised Lake Release Policy is:

1. *When the Lake is within the top 4 feet, the water demands from Bear Valley Mutual will be met with Lake releases;*

2. *When the Lake is between 4 and 6 feet below full, the District intends to obtain In Lieu water between the months of May 1 and October 31. Between November 1 and April 30, water required would be released from Big Bear Lake;*
3. *When the Lake is more than 6 feet below full, the District intends to obtain In Lieu water throughout the year.*

In 2020, the lake level was more than 6 feet below full for the entire year. The lake ended the year 13.14 feet below full.

2012 In Lieu Lake Release Agreement

In July 2012, Big Bear MWD and San Bernardino Valley MWD (Valley District) entered into a Memorandum of Understanding that allowed Valley District to deliver In Lieu Water to Mutual when the Lake Release Policy would normally call for lake releases, and, in return, Valley District would get credit for an equal amount of water stored in Big Bear Lake. The amount of water in their storage account would be reduced monthly by the amount of additional evaporation resulting from the increased surface area of the lake. This In Lieu Lake Release program began on July 1, 2012 and was scheduled to run through December 31, 2015. In 2015, the two agencies modified the existing In Lieu Agreement to extend the time Valley District could make In Lieu Lake Water deliveries to Mutual and provide Valley District with the opportunity to reduce their In Lieu SWP Water deliveries to Mutual during emergency years when their State Water Project (SWP) deliveries are significantly reduced. At the end of 2019, Valley District had stored 742 acre-feet of water in Big Bear Lake. In 2020, Valley District did not request any In Lieu Lake Releases. The additional evaporation losses in 2020 were 87 acre-feet. Valley District ended the year with 655 acre-feet in their sub-account and the Lake was 0.34 feet higher than it would have been without the Memorandum of Understanding. **Table III-9** shows the account details of Valley District's portion of Big Bear MWD's lake account.

Water Deliveries to Mutual by Big Bear MWD

Mutual received 3,667.5 acre-feet of water from Big Bear MWD in 2020. This year Mutual's needs for water from BBMWD were met by SWP In Lieu Water, and water discharged from the lake for fishery protection under SWRCB Order No. 95-4. **Table III-10** shows Big Bear MWD monthly water deliveries to Mutual during 2020.

* Also required to comply with SWRCB Order No. 95-4

The amount of water delivered to Mutual consisted of 3,079.7 acre-feet of SWP In Lieu Water, and 587.8 acre-feet of lake water they were able to use from the releases and leakage for fish protection.

In 2019, Mutual used In Lieu Water for groundwater recharge for the second time. They did not use any In Lieu Water for groundwater recharge in 2020. These deliveries could have an impact on the Basin Make-up Account. The Watermaster committee will look into this issue in 2021.

The amount of water Big Bear MWD is obligated to deliver to Mutual is limited by the Judgment. According to the Physical Solution Agreement, Article III.A.1.(b), Mutual has the right to:

“divert water, or cause water to be diverted, at such rate as may be reasonably necessary to meet the requirements of Mutual’s stockholders, not exceeding 65,000 acre-feet in any ten (10) year period, as determined by the Board of Directors of Mutual in its sole discretion.”

Table III-11 summarizes the deliveries to Mutual since the agreement went into effect. For the ten-year period ending with calendar year 2020, the amount of water delivered to Mutual by Big Bear MWD was 53,913 acre-feet. For the 44-year period the Judgment has been in effect, the average annual deliveries by Big Bear MWD to Mutual has been 4,521 acre-feet.

In 2021 Mutual can request up to 12,261 acre-feet of water from Big Bear MWD. This value is the amount that they are below the 65,000 acre-feet limitation at the end of 2020 (which is 11,087 acre-feet), plus the deliveries made in 2011 (which was 1,174 acre-feet), that will be dropped from the ten-year period ending in 2021. The 12,261 acre-feet total includes In Lieu deliveries, lake releases, and fishery outflows that Mutual is able to divert.

2019 value for SWRCG Outflows to Mutual was corrected to 251.2 AF

Table III-11 was updated December 27, 2018 to correct minor rounding problems

Mutual's Equivalent Water Diversions

Table III-12 shows the amount of water that Mutual would have diverted from the Santa Ana River if the Judgment had not been rendered. This figure is determined by adding the In Lieu State Water Project water and In Lieu groundwater deliveries as reported in **Table III-10** to the River diversions by Mutual and Mutual's groundwater production from their Canyon Well No. 1, as shown in **Table III-8**. Mutual's Canyon Well No. 2 was destroyed as part of the construction of the Seven Oaks Dam between 1994 and 1998. The value for Santa Ana River diversions includes the supply from the Redlands Tunnel. This Equivalent Water Diversion is the amount of Santa Ana River water Mutual would have to divert if their demands for water from Big Bear MWD had been met by lake releases rather than In Lieu Water deliveries. The 2020 Equivalent Water Diversions were 24,090 acre-feet.

IV. DETERMINATIONS AND ACCOUNTS

ACCOUNTING REQUIREMENTS

In accordance with Article 29 of the Judgment, "Watermaster shall maintain three basic accounts, in accordance with Watermaster Operating Criteria, as follows:

(a) District's Lake Water Operation. A detailed account to reflect actual operation of the Lake by District shall be maintained.

(b) Mutual's Lake Water Operations. In addition, a corollary account shall be maintained to simulate the effect of Mutual's operations with regard to Lake water under the In Lieu Water operations.

(c) Basin Make-up Account. An account of District's annual and cumulative obligation for Basin Make-up Water shall also be maintained."

In 1986, the Watermaster Committee developed a computer program for keeping these accounts. This program was designed to operate on an IBM (or IBM compatible) personal computer using Lotus 1-2-3. To standardize all years of operations under the Judgment, all past accounts were recalculated using the program and were included in the 1986 Annual Report.

In 1990, the Watermaster Committee decided how to account for wastewater exports from the Big Bear Lake watershed and delivery of water on Mutual stock owned by Big Bear MWD. Only the Basin Make-up Account was affected by these decisions. Consequently, the 1990 Watermaster Report contained revised tables for the Basin Make-up Accounts for calendar years 1986, 1987, 1988 and 1989, as well as the status of all the 1990 accounts.

For the 1994 report, the Watermaster Committee updated the accounting procedures to reflect 1994 Watermaster decisions and to clarify the reports.

In 1995, the Watermaster made several additional revisions to the accounting procedures. However, in preparing the 1996 accounts, the Watermaster Committee discovered some errors in

the changes made in 1995. These errors were corrected and, as a result, the 1995 accounts were recomputed and were included in the 1996 Annual Watermaster Report.

2020 ACCOUNT BALANCES

Appendix B contains the 2020 accounts. The first four pages of the appendix present the input data used to calculate the various accounts. The fifth page summarizes the status of the various accounts. The remaining pages of **Appendix B** are the detailed monthly tables of the accounts.

Actual Lake Account

Figure 2 illustrates the water balance for the actual operation of Big Bear Lake in 2020. **Table 1** of **Appendix B** provides additional detail. This information shows that:

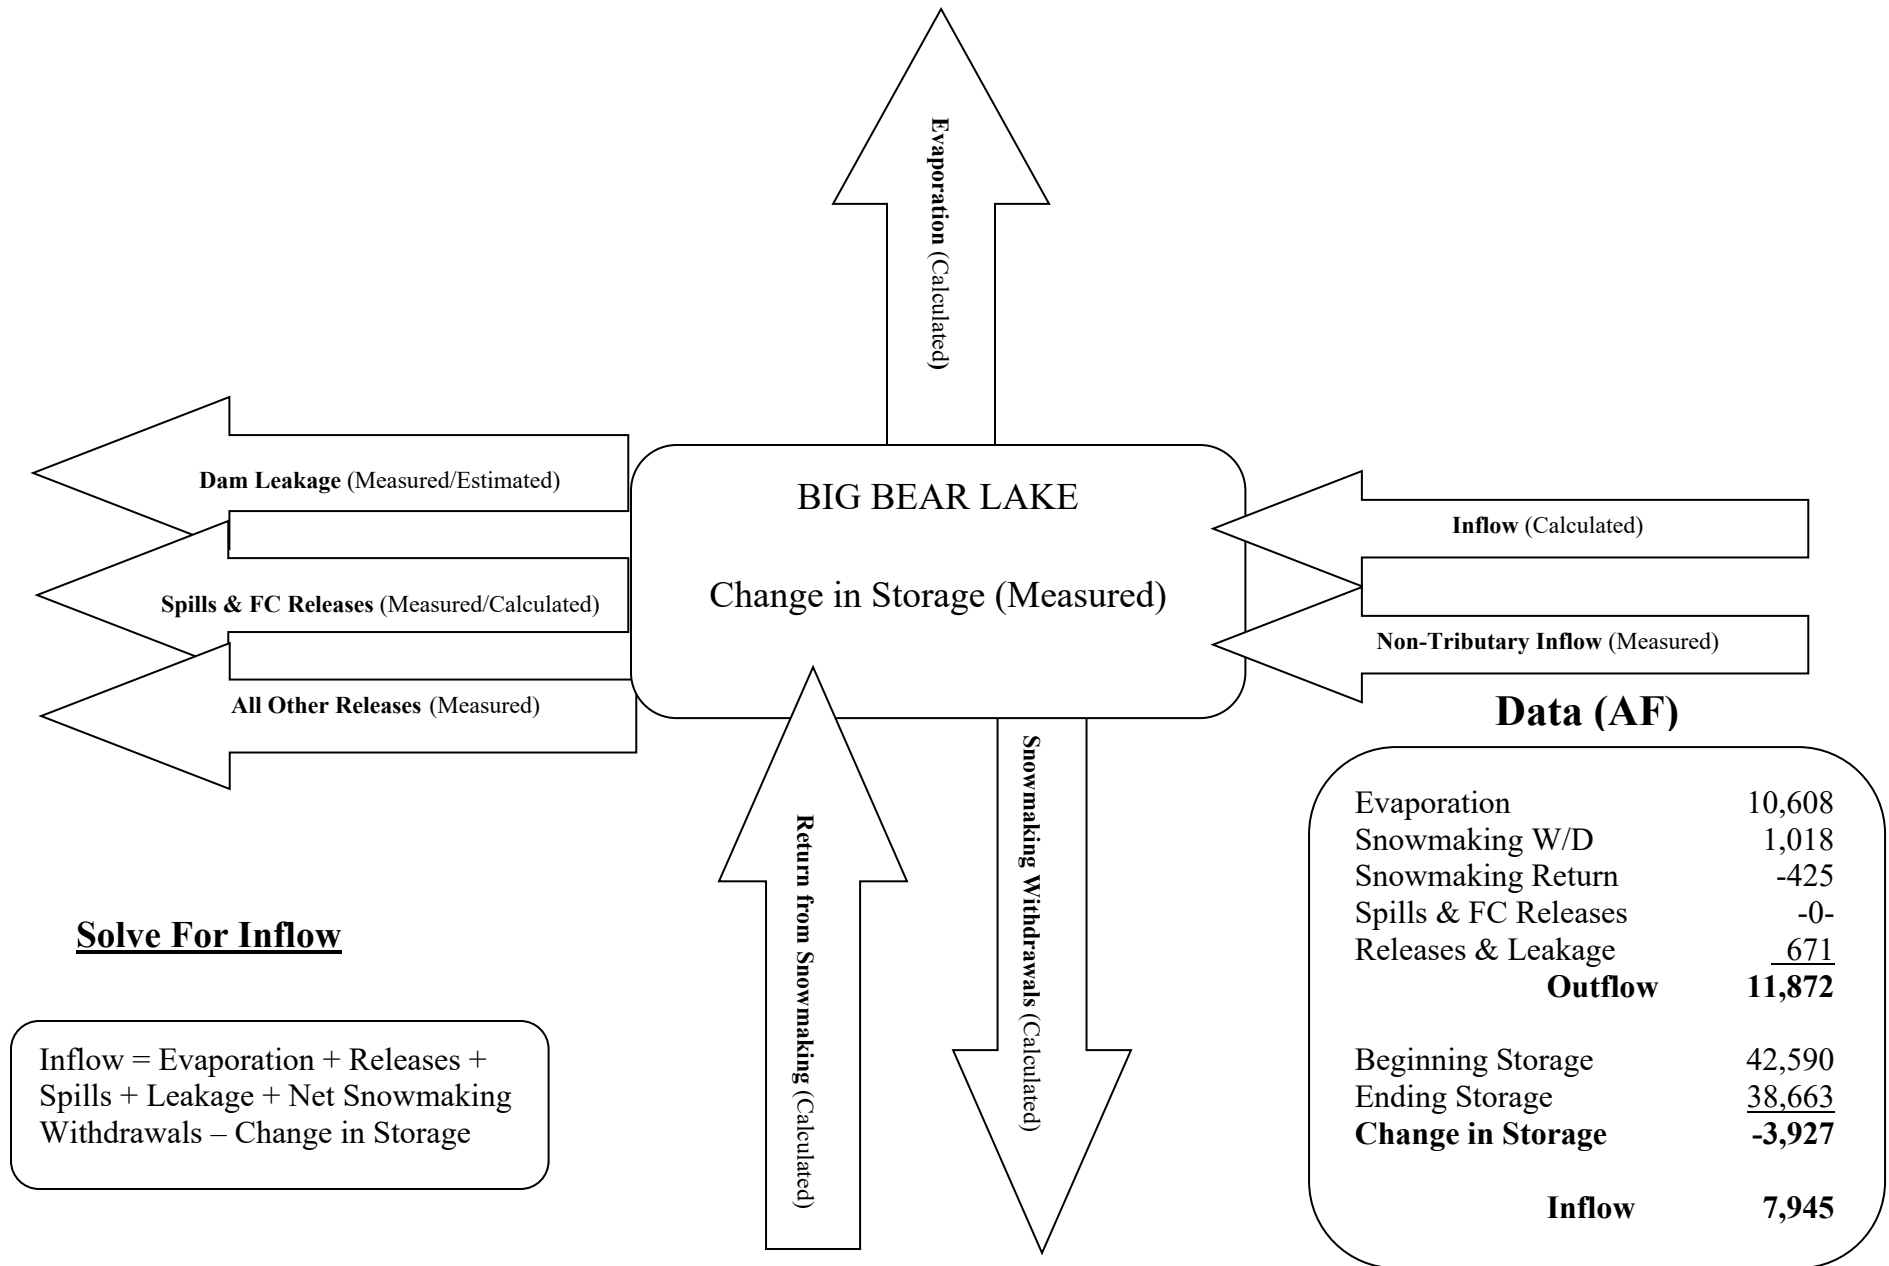

- 1) the lake level dropped 1.70 feet, from a gauge height of 60.89 feet to 59.19 feet; 72.33 feet is full;
- 2) lake storage decreased by 3,927 acre-feet, it began the year with 42,590 acre-feet and ended the year with 38,663 acre-feet; when the lake is full, it contains 73,320 acre-feet of water;
- 3) lake surface area varied between 2,252 and 2,486 acres;
- 4) evaporation was 10,608 acre-feet;
- 5) lake inflow was 7,945 acre-feet,
- 6) the total of spills, releases, leakage and net lake withdrawals was 1,264 acre-feet.

Tables 1A through **1D** provide additional details to support **Table 1**.

Mutual's Lake Account

Figure 3 illustrates the water balance for Mutual's synthesized operation of Big Bear Lake in 2020. Mutual's operation shows what would have happened if:

Figure 2
Water Balance for 2020 Actual Lake Operations

- 1) Mutual had owned the lake,
- 2) The In Lieu program was not in place, and
- 3) The net wastewater exported from Big Bear Lake watershed entered the lake as supplemental inflow.

In this synthesized case, Mutual's demands for lake water would have been met entirely from lake releases.

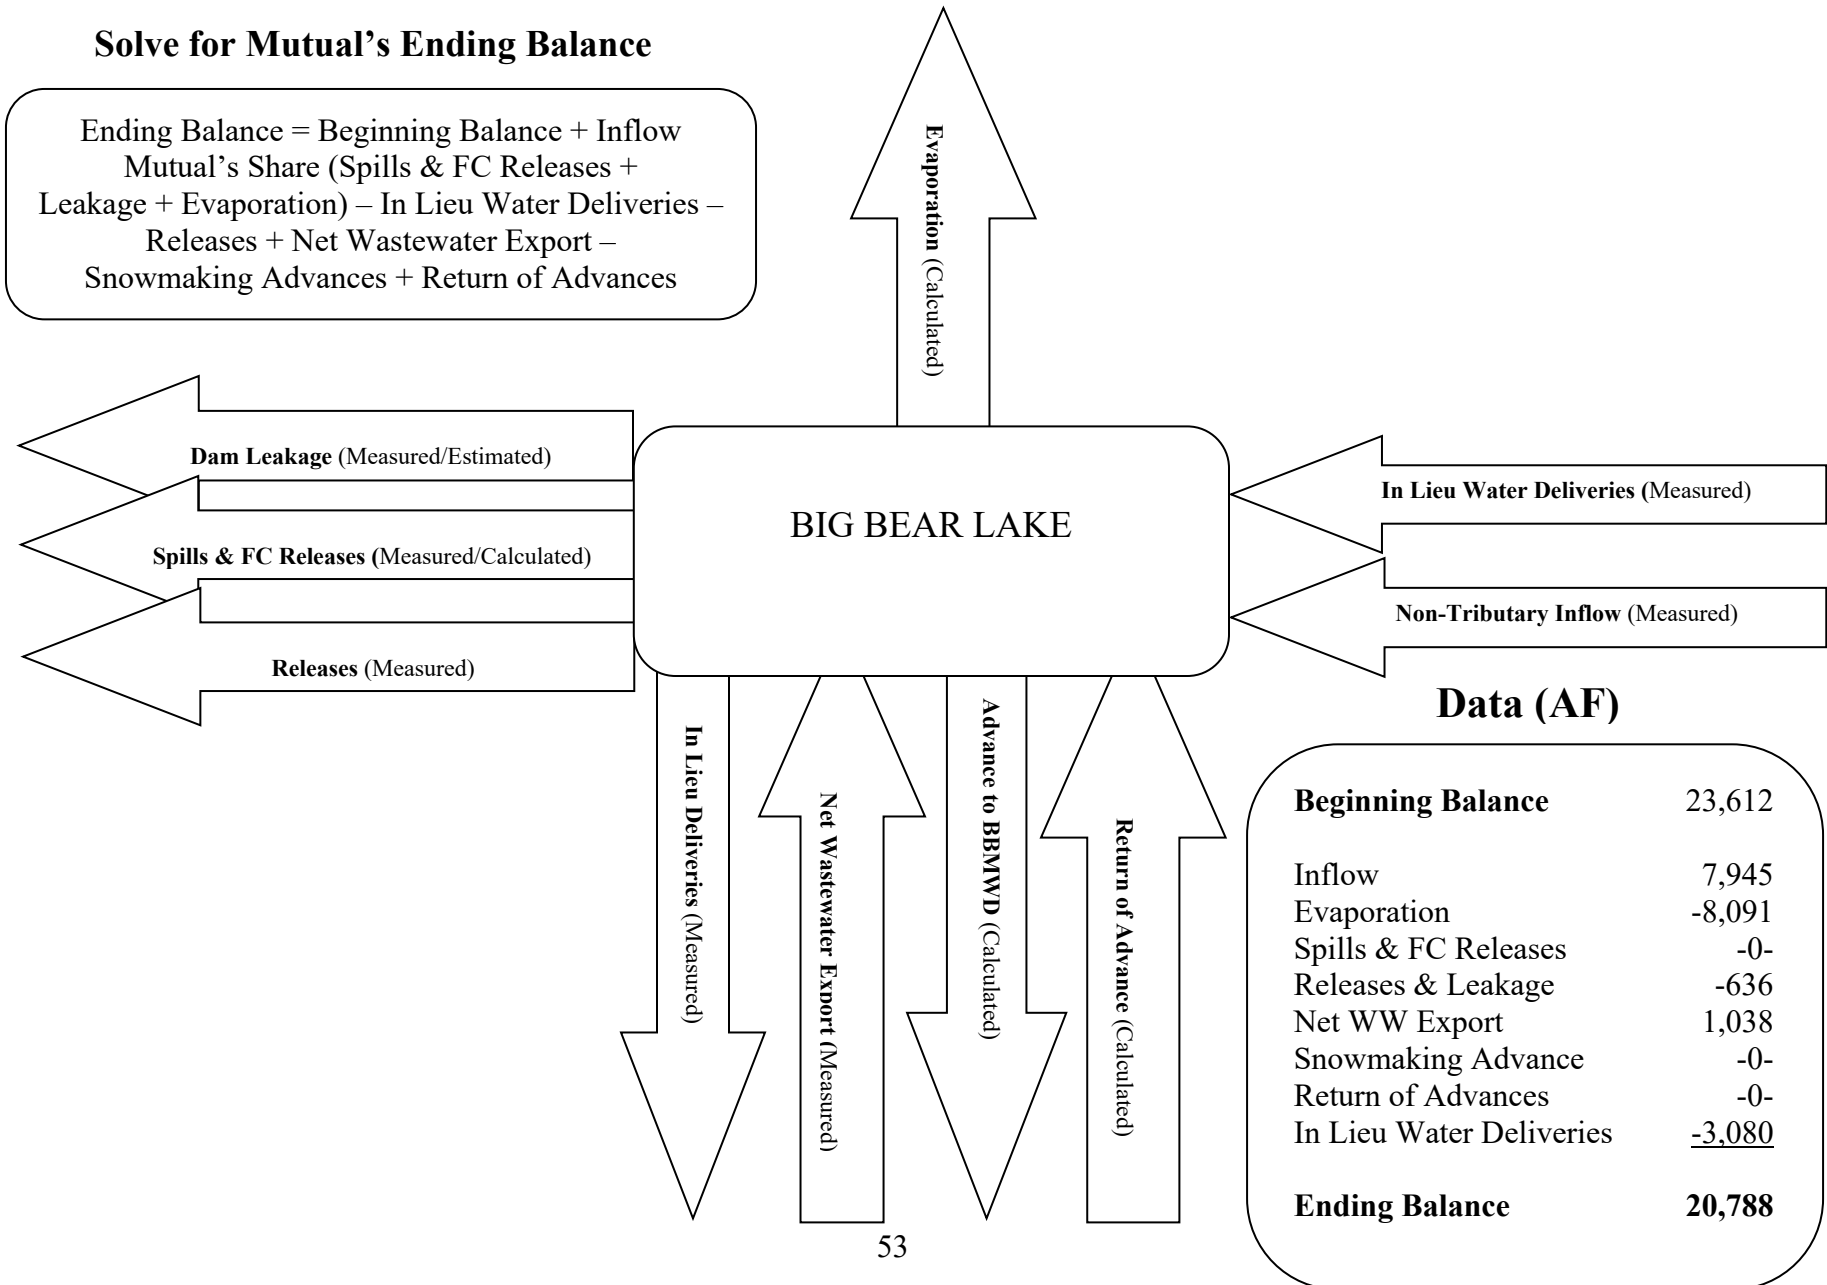

Figure 3 and **Table 2** of **Appendix B** show that Mutual had 20,788 acre-feet in its lake account at the end of 2020. This account balance is 2,824 acre-feet less than was in their lake account at the end of 2019. **Table 2** also shows that in 2020 Mutual's lake account was credited with all the lake inflow (7,945 acre-feet), the total of their releases, spills and leakage was 636 acre-feet and their In Lieu Water deliveries were 3,080 acre-feet. In 2020, supplemental inflow of 1,038 acre-feet was added to Mutual's Lake Account for net wastewater exported from the basin. In 2020, there were no advances to Big Bear MWD for snowmaking within the watershed. Evaporation that would have taken place under a Mutual operation was 8,091 acre-feet.

The cumulative effect of changes in lake releases and supplemental inflows that would have taken place since 1977 under a "Mutual Operation" would be a lake level that would have been 49.95 feet at the end of 2020 or 22.38 feet below the top of the dam. This synthesized lake level is 9.24 feet lower than it actually was. This lower lake level reflects the impact of what Mutual's lake withdrawals would have been without the In Lieu Water program and with the credits they receive from the net wastewater exports. **Tables 2A** through **2C** of **Appendix B** provide additional details to support **Table 2**.

Article 4.(b) of the Watermaster Operating Criteria (Exhibit "D" of the Judgment discusses how to handle the export of wastewater from and the import of water to the Upper Bear Creek Watershed. Specifically, it says:

In the event gross export from Upper Bear Creek Watershed to any area not tributary to the Santa Ana River Watershed within Upper Bear Creek Watershed, calculated inflow to the Lake shall be increased each year, beginning with the calendar year 1986 by the amount by which such gross export exceeds imports. If gross import exceeds gross export, said excess shall be credited against District's Basin Make-up Water obligation.

Figure 3
Water Balance for 2020 Mutual's Lake Operation
 (Synthesized Conditions)

In 1986, the Watermaster Committee decided to handle the net wastewater exports (gross exports-gross imports) entirely in the District's Basin Make-up water obligations. This decision was contingent upon implementation of a wastewater reclamation project in the Upper Bear Creek Watershed by December 31, 1994. A reclamation project was not implemented by that date so the Watermaster Committee, in 1994, decided to add the net wastewater credits to the calculated lake inflows effective January 1990. This decision adds the net wastewater credits to Mutual's lake account. Essentially, it transfers the amount of the credit from Big Bear MWD's lake account to Mutual's lake account.

Table IV-1 shows the impacts of crediting Mutual's lake account (and debiting Big Bear MWD's lake account) with the net wastewater exports. Since 1990, Mutual has been credited with 39,274 acre-feet of net wastewater exports. After 31 years of getting these credits, Mutual's lake account has 5,013 acre-feet more water than it would have had if it hadn't received the credits. This additional increase raised their simulated lake level by 3.15 feet. In other words, without the credits, Mutual's lake account would have been 15,775 acre-feet and their lake level would have ended the year at 46.80 or 25.53 feet down. In other words, it would have been 12.39 feet below the actual lake level of 59.19 feet and 3.15 feet lower than reported in Mutual's lake account tables (49.95 feet).

There are two primary reasons why the increase in their lake account (5,013 acre-feet) is less than the cumulative credits they have received (39,274 acre-feet). The first reason is spills. When the lake fills, Big Bear MWD's water spills first, and then Mutual's water spills. The Wastewater export credits they receive will spill during very wet years, like 1998. The second reason is evaporation. Mutual's lake level increases with the credits. With higher lake levels, their share of the evaporation losses increases. The end result is that at the end of 2020 Mutual's lake account had 5,013 acre-feet more and Big Bear MWD's lake account had 5,013 acre-feet less as a consequence of the net wastewater export credits.

*The lake is empty at a gauge height of 23.0

** The 2018 Storage Account and Lake Level Values were incorrectly reported in the 2018 Watermaster Report; the corrected values are shown above

Big Bear MWD's Lake Account

Section 3(b), District's Water in Storage, of the Watermaster Operating Criteria of the Judgment describes the procedure to determine Big Bear MWD's storage account as follows:

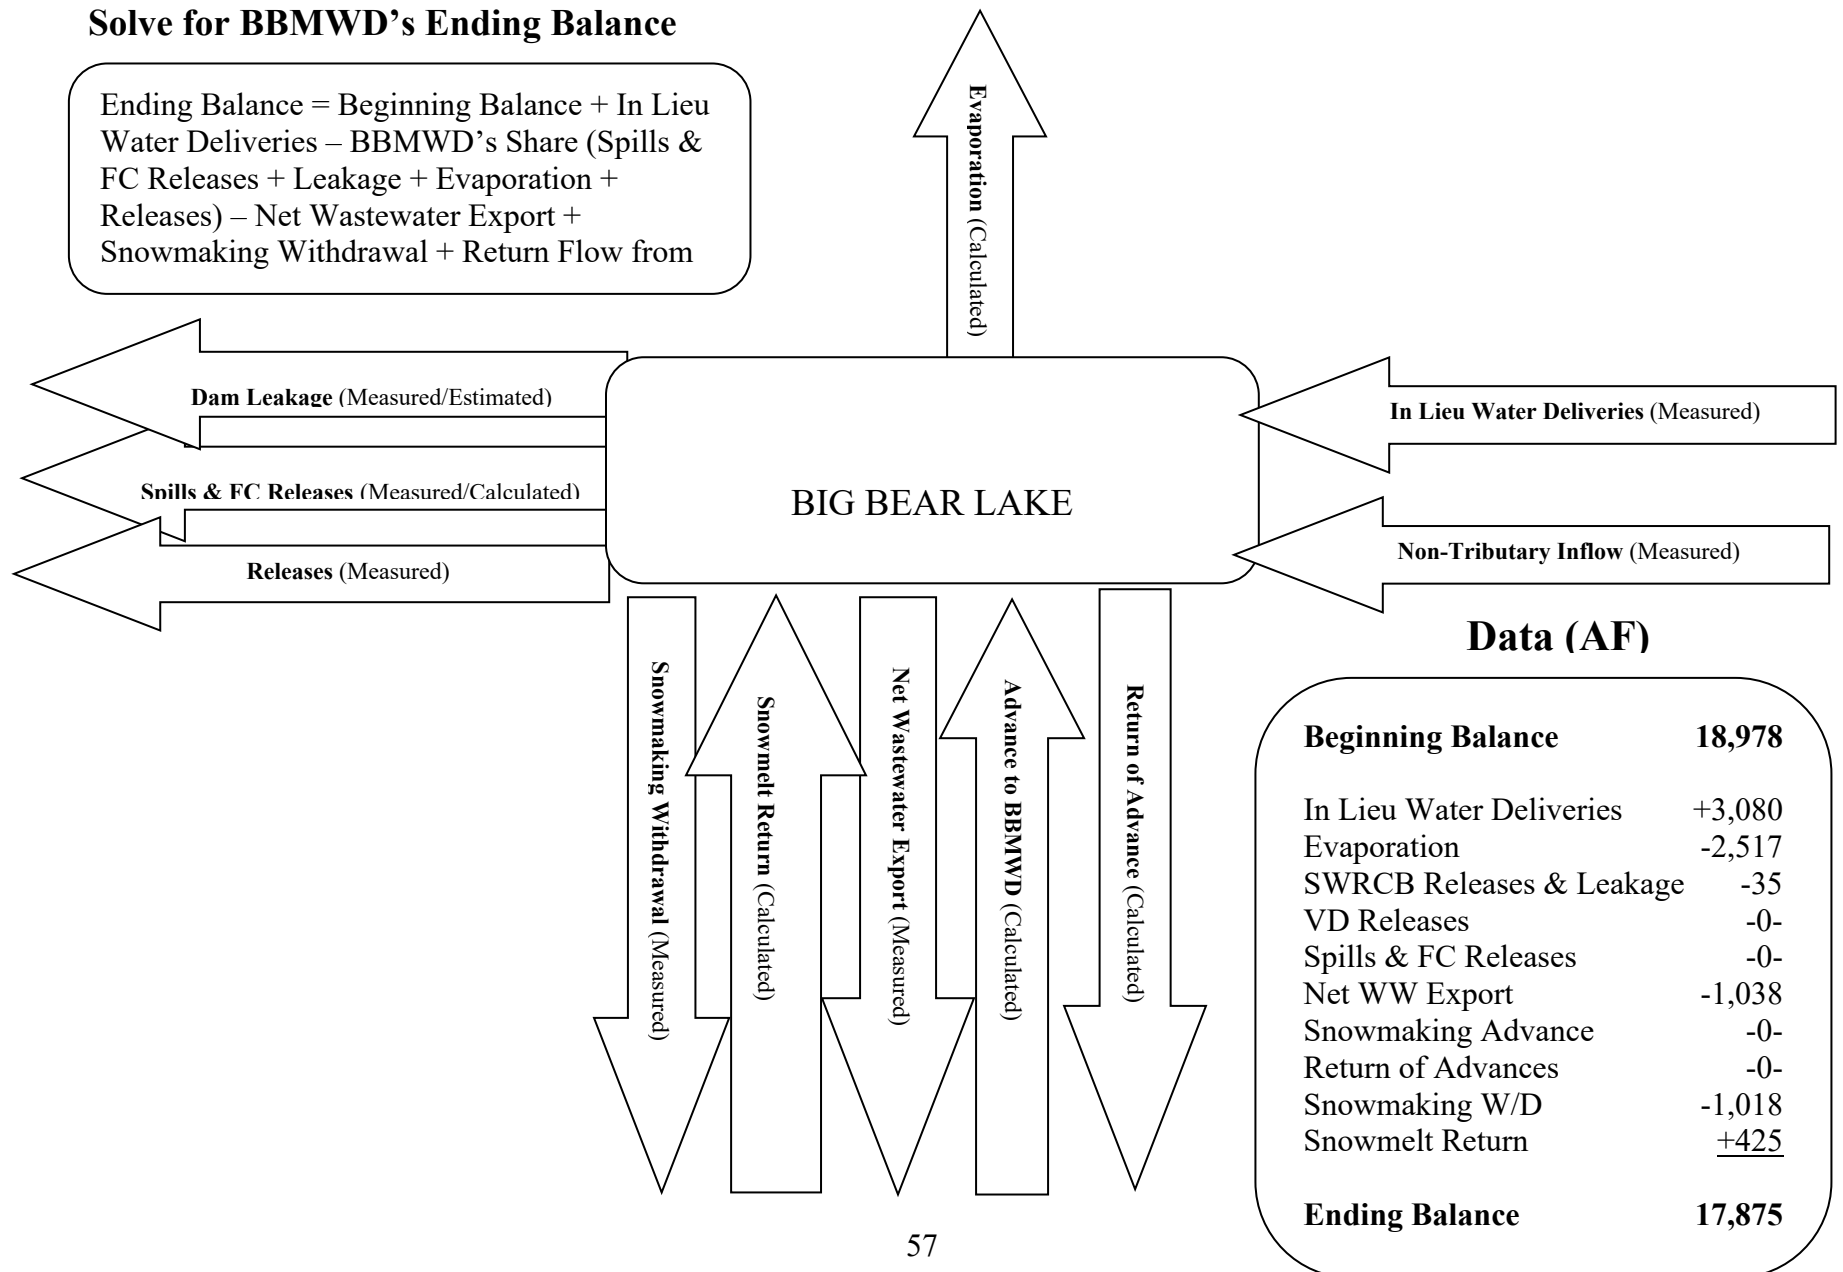

“Any water actually in storage in excess of Mutual's water in Storage, as calculated above, shall be for the account of District. So long as District has water in storage, all spills from the Lake shall be deemed District Water.”

Figure 4 illustrates the water balance for Big Bear MWD's lake account in 2020. Table 3 of **Appendix B** summarizes the results. This information shows the water actually in storage (from **Table 1** of **Appendix B**), Mutual's water in storage (from **Table 2** of **Appendix B**), and the difference between the two, which is the amount in Big Bear MWD's account. In 2020, Big Bear MWD's account balance began with 18,979 acre-feet and ended the year with 17,875 acre-feet. The decrease in their account was 1,103 acre-feet. This decrease was because the In Lieu Water deliveries to Mutual during the year were less than the evaporation losses, SWRCB releases, net snowmaking withdrawals and net wastewater exports.

Table 3 of **Appendix B** also shows the status of Big Bear MWD's "Advance Account". This account represents the net amount of water Big Bear MWD has "borrowed" from Mutual for snowmaking in the Big Bear Lake watershed. In 2020, Big Bear MWD's advance account was zero throughout the year.

Tables 3.A and **3.B** of **Appendix B** provide supporting information to Table 3.

Water Balance for 2020 BBMWD's Lake Operation
 (Synthesized Conditions)

Basin Make-up Account

Exhibit D of the Judgment contains a formula to be used for determination of the amount of Basin Make-up Water, if any, that is needed to offset deficiencies in the recharge supply to the San Bernardino Groundwater Basin. **Tables 4, 4A, 4B and 4C in Appendix B** follow the formula presented in the Judgment for calculating the credit or deficiency in the Basin Compensation Account. The formula contained in the Judgment is:

Deficiency or Credit =

$$[(.50) (R_d) + (.51) (S_d) + (.50) (P_d)] - [(.50) (R_m) + (.51) (S_m)]$$

wherein:

R_d = Releases actually made under District Operation.

S_d = Spills which actually occurred under District Operation.

P_d = In lieu water purchased by District from San Bernardino Valley MWD or the Management Committee of the Mill Creek Exchange and delivered under District Operation to Mutual for service area requirements.

R_m = Releases which would have been made under a Mutual Operation.

S_m = Spills which would have occurred under a Mutual Operation.

The first three terms in the equation represent the recharge that occurs under Big Bear MWD's lake operation. These are referred to as the "Big Bear's Basin Additions" in **Table 4. Table 4.A** shows the details of the calculations for these three terms.

The last two terms in the equation represent the recharge that would have occurred if Mutual had owned and operated the lake and met its supplemental water needs from lake releases. Collectively these terms are referred to as "Mutual's Basin Additions" in **Table 4. Table 4.B** shows the detailed calculations for these two terms.

The monthly net credit or deficiency in recharge to the San Bernardino Basin is shown in Column 5 of **Table 4**. These calculations are in accordance with the formula in the Judgment.

The Judgment also requires Big Bear MWD to make-up for deficiencies in recharge that would occur as a result of their lake operations. Column 7 of **Table 4** shows the amount of water recharged by Big Bear MWD in the San Bernardino Basin to correct (or prevent) deficiencies in recharge. **Table 4.C** presents details of the sources of water used to replenish the Basin Compensation Account.

Table 4 of Appendix B presents the status of the Basin Make-up Account for 2020. The account balance began the year with a balance of 27,028 acre-feet and ended the year with 27,046 acre-feet. There was an 18 acre-foot increase in the Basin Make-Up Account in 2020. The reason for the increase was a small recharge credit for the additional fish releases under a District operation.

In 2019, Mutual delivered In Lieu Water for groundwater recharge for the second time. Mutual did not deliver any In Lieu Water for groundwater recharge in 2020. The Watermaster Committee has agreed to review the impact of this new use of In Lieu Water on the Basin Make-up Account. The 1977 Judgment did not anticipate this use of In Lieu Water and the formulas used to determine the Basin Make-up Account balances may have to be revised to reflect this new use. The Watermaster Committee will continue to address this issue in 2021.

V. OTHER WATERMASTER ACTIVITIES

IMPACTS OF SEVEN OAKS DAM

History and Background

Construction of the 550-foot high Seven Oaks Dam (SOD) by the U.S. Army Corps of Engineers (Corps) began in 1990 and was completed in 1998. The plunge pool by-pass pipeline was completed in 2001, which routes low flows, for beneficial use by either Mutual through its "River Pick-up" or by SBVWCD at its main river diversion, through the Dam, around the plunge pool, and back to the river channel.

Two features of SOD can affect Watermaster activities. First, the SOD prevents the natural subsurface flow of groundwater from leaving the Santa Ana River Canyon and causes all groundwater coming from upstream of the Dam to rise to the surface and pass through the dam outlet structure. The plunge pool by-pass line helps to overcome the loss of these subsurface flows. Second, when the SOD impounds storm flows behind the Dam for extended periods, it causes water quality degradation.

In 1993, San Bernardino Valley Municipal Water District (SBVMWD) and Western Municipal Water District (WMWD) of Riverside County provided funding to the Corps for a water conservation study to evaluate SOD as a dual-use structure for flood control and water conservation. The possible impoundment of waters of the Santa Ana River for uses other than flood control raised some water rights issues. Several diversion points for SBVWCD, North Fork Water Company, Mutual, and Redlands Water Company ("Below the Dam Diverters") are downstream of SOD, and the Dam altered the operation of these historical diversion points. It was the intent of the "below the dam diverters" to have releases from SOD approximately average annual natural flows, recognizing that flood control release flows were expected to have less silt at low release rates than previous flows and maybe more evenly distributed. Their request was to have the amount of water to be impounded behind SOD for uses other than flood control determined after the combined needs have been met for (1) the water supply agencies to provide

direct delivery water and (2) the integrity of the groundwater basin is stabilized by assuring groundwater levels are maintained within an appropriate operating range.

Water Rights

In 1995, SBVMWD and WMWD filed a petition to revise the Declaration that the Santa Ana River Stream System is Fully Appropriated and an application to Appropriate Water By Permit with the State Water Resources Control Board (SWRCB). The petition and application were to give the two local agencies the right to impound water behind SOD, subject to the operational directions of the Dam for flood control. In 2000, the SWRCB adopted Order WR2000-12 to process the application filed by SBVMWD and WMWD and for the processing of a water right application filed by Orange County Water District (OCWD). In 2001 the water rights application (AO31165) was filed by SBVMWD and WMWD, and the water rights application (AO31174) filed by OCWD were accepted.

In 2001, SBVMWD filed a second application, and SBVWCD applied for the right to use Santa Ana River water that would initially be impounded behind SOD, then released for downstream use. In 2002, the SWRCB noticed the water rights applications filed by SBVMWD, WMWD, and OCWD, and a Pre-Hearing Conference and Public Hearing were noticed for the water rights applications filed by the Chino Basin Watermaster, SBVMWD/WMWD, SBVWCD, and the City of Riverside. During the Pre-Hearing Conference, all parties agreed to accept the evidence, which resulted in Order WR 2000-12 revising the fully appropriated stream designation for the Santa Ana River. Consequently, the SWRCB adopted WR 2002-6 during its Public Hearing on July 2, 2002. Following the hearing on July 2, the protest period for Applications 31165 and 31174 was closed on July 17. Several protests were submitted and responses provided, but no further action occurred.

In 2008, the SBVWCD and SBVMWD conducted a study of the water spreading capacity of facilities downstream of SOD. Major conclusions of the study were that the area is ideal for recharge and not inhibited by clay or silt, faulting may interfere with the recharge in the eastern end, and very high flow years will saturate the spreading grounds. Additionally, structural capacities limit regular use to 300 cfs, and further to the west, the stable flows are limited to about 150 cfs. This study gave rise to the Enhanced Recharge Project, which would be permitted under SBVWCD Wash Plan HCP and SBVMWD River HCP. Construction of Phase 1A of the Enhanced

Recharge Project, which includes a sedimentation basin to improve the water quality of spreading flows, was completed in 2019. Phase 1B and 1C are currently in the final design and permitting process to allow construction and operations. This will, then allow the water rights decisions to be perfected to a license.

Initial Operations and Water Quality

The Corps and the Local Sponsors (San Bernardino and Orange County Flood Control Districts) initially operated the Dam under the Interim Water Control Plan, and in 2004 the Dam began operation under the Water Control Manual for the Seven Oaks Dam & Reservoir. The Manual required that during the storm season (October to May), a debris pool (water surface elevation of 2,200 feet) be formed to protect the intake tower from sediment intrusion. After the storm season, the Corp begins releasing water from the debris pool to start their maintenance activities.

The Watermaster Committee was concerned that the current operations of Seven Oaks Dam could restrict the operations of Big Bear Dam and the in-lieu program as described in the 1977 Judgment. These restrictions could include, at a minimum, reduced releases and increased in-lieu requirements when:

- SCE facilities are out of service, and the quality of water behind Seven Oaks Dam is unacceptable to Mutual.
- SCE facilities are operating at capacity, and the quality of water behind Seven Oaks Dam is unacceptable to Mutual.
- SCE facilities are out of service or operating at capacity in the fall and winter months when the Debris Pool is being filled, and there are no releases from Seven Oaks Dam.

In addition, any reduction in releases from the Lake would increase lake evaporation and decrease the long-term average deliveries to Mutual. These restrictions could also constrain Big Bear MWD's opportunities to beneficially use the flood control releases they would make from Big Bear Lake in the late fall and winter months.

It was quickly observed that the raw water discharged from SOD was of poor quality and adversely impacted the ability of the two downstream water treatment plants, one owned by East Valley

Water District (EVWD) and the other owned by the City of Redlands (COR), ability to treat the water. If the upstream flow is diverted around the debris pool, such as when the Edison Facility is operational, there were significantly lower adverse impacts at their respective plants. A 2004 study showed turbidity increasing from 2 NTU to between 5 to 80 NTU when released from the debris pool with similar effects noted with increased color units, iron, manganese, and TOC. These readings indicate poorer quality water than historical Santa Ana River water quality conditions when water is passed through the debris pool.

In 2005, representatives from the Basin met with Congressman Jerry Lewis to describe the situation and seek Federal assistance to solve the problem, and Congress appropriated \$1,000,000 to study the issue. This report identified that water quality impacts included longer durations and elevated levels of turbidity, total organic carbon, color, iron, manganese, algae, and taste and odor-causing compounds, as well as water supply impacts, including less supply in dry hydrologic years, reduced stores in Fall through Winter as the debris pool behind the Dam is filled, and extended periods the SCE facilities are out of service after flood events. During these extended periods, the SCE facilities cannot divert high-quality Santa Ana River (and Bear Creek) water around SOD. The report recommended long-term comprehensive alternatives, including pretreatment of the water delivered from SOD to achieve the water quality levels that existed before the Dam was constructed and hardening of the SCE facilities to be more reliable and remain in-service for longer periods. The recommended interim solution was to purchase imported SWP water from SBVMWD to replace the water that could not be used because of water quality problems, or that was not available due to dam operations and SCE facilities' unavailability.

The COE undertook a two-year \$3.5 million study of these issues and completed its draft study of the steps taken to address the water quality degradation in 2008. The report verified the original methodology used in calculating the effects of placing a dam that interrupted the natural flow of the Santa Ana River for purposes of flood control and water retention to maintain a predictable daily controlled water flow for downstream users. The report noted through modeling techniques based on field record data that there appeared to be no negative effect on the Santa Ana River water quality. The downstream users contend otherwise that the very nature of the water being retained behind the Dam for lengthy periods caused algae and bacterial growth, caused water to become stale and stagnant, and tended to plug up the pervious rock and soil layers of the downstream spreading basins.

At Congressman Lewis's urging, the Corps resumed bi-monthly talks with interested downstream prior rights and permitted water users. The Corps was willing to change the method of its operation if the downstream users agreed to accept responsibility for downstream water quality. The Corps and local sponsors began design efforts for a drained debris basin to reduce water held by the Dam in low water conditions. This change would improve water quality but slightly reduce the water conserved. The Corps and local sponsors of the SOD project were unable to complete the documentation and environmental clearance for water quality improvements to the reservoir.

Testing Operations and Edison Facilities

The 2004-2005 water year began with higher rainfall. Late rains in 2004 had started to fill the debris pool behind the Dam. Heavy rains in 2004 and 2005 more than filled the debris pool, and there was approximately 40,000 acre-feet of water stored behind the Dam at an elevation of roughly 2,390. The Corps decided to test the operating valves for flood releases, and when high-velocity releases were taking place, a portion of the outlet tunnel failed, and the tests were terminated. The repairs to the tunnel were not completed until November 2005.

Operations in 2007 began with a release of approximately three (3) cfs from Seven Oaks Dam. The Corps slowly raised the reservoir elevation. During the last two weeks in April, the Corps and local sponsors had hoped to accumulate enough water to test the Seven Oaks Dam tunnel repairs, which were completed in early 2006 but never subjected to test flows. Unfortunately, there was insufficient water behind the Dam, and the "high flow" testing lasted only approximately six (6) hours.

In December 2010, heavy rains began, and the increased Santa Ana River flows were stored in the reservoir behind SOD. In mid-February 2011, the Corps operators utilized the stored flows to complete testing of the high flow capability of the Dam, ultimately releasing approximately 7,000 cfs in March 2011 from the dual main gates at the outlet works. The flow was reduced shortly thereafter, and flows of 1,000 cfs were maintained for several days, almost emptying the reservoir. At this time, the flows were reduced further to facilitate water conservation and Santa Ana Sucker spawning. At the conclusion of successful testing, the facility was considered complete, and the operation was transferred to the local sponsors.

Local Sponsor Operations

In contrast to 2011, precipitation in 2012-2015 was about 50% of normal, and this reduction in rainfall was seen in the watershed for Seven Oaks Dam. Little water was stored behind SOD, and most outflows were clean and useable by surface diverters. Most water entering the Dam flowed out at the same rate for use by surface diverters and conservation. State Project Water was available in limited quantities, and significant basin groundwater had to be used to make up water needed or guaranteed to local uses. Water levels behind SOD were at nearly historic lows due to drought.

In 2016, flow rates remained at historic lows for most of the year, with on average ten (10) cfs or less from the Santa Ana River for the period of May through October. SOD remained 50 feet below the debris pool elevation for much of the year, which meant surface water users could use the water for most of the year with minor disruptions. Fortunately, the availability of State Project Water had greatly improved and was used not only to make up for the lack of local surface water supply but was also recharged into the groundwater basin. In 2016, a lawsuit was filed by the Endangered Habitats League and the Center for Biological Diversity related to the construction and operation of SOD effects on the San Bernardino Kangaroo Rat and Santa Ana Sucker.

2017 brought some decent rainfall with moderate and sustained outflows from the Seven Oaks dam between 50-250 cfs through April. Dam operators worked with the spreading operators to keep discharges from the Dam from exceeding 250 cfs. Water quality was not an issue in 2017 as the water was not allowed to sit behind the Dam for extended periods. Edison was also able to generate electricity for the entire summer, which allowed for higher quality water. Northern California had historic rainfall levels meaning State Project Water was widely available, and flows helped to relieve some pressure in the groundwater basin that has been caused by several years of drought.

Operations in 2018 saw a return to less than average rainfall. There were only 16 days in April where greater than ten (10) cubic feet per second was released from the Dam for downstream users. Southern California Edison had to cease generating operations in mid-August due to limited flow rates and was only able to begin generating again in December.

A new management entity, the San Bernardino Basin Groundwater Council, was formed in 2018. The goals of the Council were to prepare for and coordinate the management of groundwater supply resources throughout the Basin and to coordinate maintenance of conveyance and recharge facilities to expedite such management.

Operations in 2019 brought above-average rainfall, including one particularly warm storm on February 14, which caused debris that damaged the Edison intake. Edison was unable to generate for 186 days during 2019 due to damages at their intake and high-water levels behind SOD, which rose above 2,300 ft with releases of approximately 700 cubic feet per second occurring in May. Water quality was an issue for downstream users because water was not available from the Edison facilities until August.

In 2019 the Exchange Plan members began to meet for the first time since 2003 to update the plan and address issues that were not included in the original plan. These issues were highlighted by the poor water quality supplies behind the SOD. A new possible exchange would be to swap Santa Ana River water from behind SOD for imported water for direct use by Mutual, leaving the more turbid water for groundwater recharge.

Current Period Operations

Below average rainfall, with limited availability of State Project Water, characterized 2020 operations. SOD water elevation reached the debris pool level, and water was released in April at flows between 100-200 cfs. Water quality was not an issue as no water was stored behind SOD for significant periods. Edison ceased generation at both its powerhouses in March of 2020 due to the COVID-19 Pandemic, and electrical generation is not anticipated to resume until the Pandemic has ended. Flows were still diverted at Powerhouse #1 to the Mutual Highline and the Greenspot Spill, but in lower quantities, than previously diverted when Powerhouse #3 was in operation. Constant use of the Greenspot Spill has caused degradation of the facility, and its use has been limited to eight (8) cfs.

Work on both the Exchange Plan and the design plans for the Enhanced Recharge Phase 1B and 1C continued in 2020. The downstream water rights holders formed a consortium to approach Edison about purchase of the powerhouses on both the Santa Ana River and its tributaries. When

Edison's facilities are damaged or down for maintenance, high-quality water flows into the inlet pool of SOD or flows past water-rights holders on the tributaries. Edison's water rights are non-consumptive for the generation of electricity. The limited value of the electricity from small hydro facilities influences their O&M decisions and restoration after damage.

QUAGGA MUSSEL PROTECTION PROGRAM

The invasive Quagga Mussel became a significant threat to Big Bear Lake in 2008. Big Bear Municipal Water district launched a ground-breaking program at the beginning of the boating season to prevent the mussel from getting into the Lake. While once only a problem east of the 100th Meridian, the mussel reached western lakes, and most significantly, Lake Mead, in January 2007. By the fall of 2008, the mussel was pervasive in Lake Mojave and Lake Havasu. Boaters traveling to and from the lakes were transporting microscopic larvae in bilges and outdrives, creating a threat to Big Bear Lake. The California mussel population expanded via the Colorado River aqueduct turnout at Parker Dam into receiving reservoirs in San Diego County. Other southern California lakes became infested when infected boats transported the microscopic mussel larvae.

The Quagga Mussel is a prolific reproducer and colonizes every solid object it encounters. This leads to clogged pipes, damage to vessels, and out-competition of the native species. Also, because each mature mussel can filter feed about one liter of water daily, huge mussel masses significantly reduce concentrations of plankton, which are an essential food supply for lake and reservoir fisheries.

In our situation the potential impact of an infestation is exponential because Big Bear Lake is at the top of the Santa Ana River watershed. Every water body and stream below the Bear Valley Dam could become infected, and the resulting impacts to Bear Creek fisheries could suffer, the impoundment behind Seven Oaks Dam, the Edison power generating station, and the Santa Ana River all the way to the ocean.

In response to the threat the District imposed new rules on launching, installed traffic control structures to prevent unauthorized launching, and strictly regulated the launch ramp hours to provide constant staffing at the start of the 2008 boating season. All boats entering in the Lake at

public launch ramps were required to complete a questionnaire to determine if and when they might have been in an infected lake. They were also checked for standing water in bilges, lockers, bait wells, live wells, ballast tanks, etc. All vessels deemed suspicious by District inspectors were decontaminated at no charge to the boat owner with pressurized hot water (140°). Some limited training was also provided to commercial ramp operators who were responsible for sending suspicious vessels to a District facility for decontamination.

Both the City of Big Bear Lake and Snow Summit Resort contributed one-time funds at \$5,000 to help defray the costs associated with the unexpected burden on the financial resources of the District. Nearly \$100,000 was spent during the summer of 2008 for educational materials, signs, additional summer staffing, and capital improvements to the Quagga Prevention Program.

Sampling at the end of the 2008 boating season revealed that Big Bear Lake was free of visible mussels. Beginning in 2009, sampling for the microscopic mussel larvae began as soon as the Lake warmed to 53°, the minimum temperature at which the mussels can reproduce.

In 2009, a Quagga Prevention Program surcharge was added to boat permits to offset the costs associated with the program. The surcharge will remain in place as long as a threat exists or as grant money becomes available from the State. With the number of Quagga Mussel infested lakes in southern California increasing, and the proximity of recreational boating opportunities such as the Colorado River, the threat of infestation becomes greater. New, more stringent protective measures were implemented at the start of the 2009 boating season. These include training the entire public and private marina work force operating on the Lake, requirements for commercial marinas to staff launch ramps with certified Quagga Mussel inspectors, significant limitations on the use of private launch ramps, and an expanded program of boat decontamination with pressurized hot water at both public launch ramps and the District main office.

Starting in 2009, the BBMWD began offering Watercraft Inspection/Decontamination Training (WIT) certification to all of the private marina workers, allowing all participating marinas to inspect vessels before launching them. The BBMWD also adopted strict standards for the usage of private launch ramps (launch ramps on single family properties), requiring them to be able to be locked closed to prevent unauthorized access. Additionally, these private owners were

required to meet personally with District personnel to receive Quagga Mussel education. In 2011, the BBMWD had a total of four WIT III certified staff, allowing them to teach the WIT I and II provided to the BBMWD seasonal staff and marina workers. By 2012, the BBMWD had three decontamination stations, one at the East Public Launch Ramp, one at the West Public Launch Ramp, and one at the BBMWD main office (used only for special events and full decontaminations). The station at the main office got usage in 2014, as inspectors found ten Quagga infested boats. Four of these vessels went to the main office for full decontamination and six were decontaminated at the East Public Launch Ramp.

In 2016, using Department of Boating and Waterways funding, an additional decontamination station and improved decontamination machines were installed at the East Public Launch Ramp. Following the decontamination upgrades, the BBMWD was able to purchase a Flow-Cam in 2017, using Department of Boating and Waterways funding, which allowed for in-house Quagga Mussel monitoring. In 2018, an enclosure for the decontamination units at the East Public Launch Ramp was constructed, protecting them from theft and the elements. The District continued to monitor for potential Quagga Mussel infestation through substrate monitoring at various points around the Lake and by sending plankton tow samples to the California Department of Fish and Wildlife Bodega Bay Shellfish Laboratory for cross-polarized light microscopy analysis and DNA testing.

In 2019, the Watercraft Inspection and Decontamination data collection system (WID) was implemented at the Public Launch Ramps. Protocols for plankton tow sampling to be sent off to the California Department of Fish and Wildlife Bodega Bay Shellfish Laboratory were changed for more accurate results. Finally, after reports of New Zealand Mud Snails being found in Bear Creek (several miles below the Bear Valley Dam), the District performed an informal survey looking for New Zealand Mud Snails in Bear Creek, as well as formal surveys and setting traps in Big Bear Lake to search for a snail infestation. No New Zealand Mud Snails were found in either location.

2020 Activities

In 2020, the boating season had a late start. Due to the COVID-19 pandemic, the Public Launch Ramps did not open until May 1. Despite this late start, the 2020 season was the busiest in BBMWD history. All facilities were full to capacity daily throughout peak season.

Over the summer of 2020, the District employed eight seasonal ramp attendants to inspect and decontaminate vessels as they arrived at the Public Launch Ramps. In total, the District launched 15,043 vessels in the 2020 boating season. Of these, 3,125 were inspected at the Public Launch Ramps. Of the 3,125 inspections, 2,392 were clean and no decontamination was necessary, 451 boats were decontaminated, and 282 boats were turned away. A total of 11,918 boats were banded with a tamper-proof wire to be certain that the boat had not left the trailer after leaving our Lake.

The District monitored water for the presence of Quagga Mussels in Big Bear Lake, similar to years past. Due to shipping issues caused by the COVID-19 pandemic, two of the three plankton tow water samples made it to the California Department of Fish and Wildlife Bodega Bay Shellfish Laboratory. All viable samples came back negative for Quagga Mussel Veligers. (See Tables 1 and 2)

Additionally, the District checked the Quagga substrate at various points around the Lake to confirm that there were no Quagga growing. After being checked all season, no indication of Quagga Mussels were found. (Table 3)

Table V-1: Plankton Tow Sample Sheet August 2020

Results Summary

No	Sample descriptions Big Bear Lake Locations	CPLM (veligers)	pH at time of analysis	Lake-equivalent volume examined
1	8/13/20 Dam	not detected	8.93	1600 liters
2	8/13/20 Gilner Point	not detected	9.24	1600 liters
3	8/13/20 Mid Lake / Middle	not detected	9.25	800 liters
4	8/13/20 Stanfield Middle	not detected	8.73	400 liters

All artificial substrates removed from lake after 10/20/2020, as temperatures dropped into range that is not conducive to quagga mussel spawning. Artificial substrates will be placed in Spring 2021.											

In an attempt to incentivize boaters to bring their vessels to the launch ramps Clean, Drained, and Dry, the District implemented a fee schedule for decontaminations. The fees were \$40 for small fishing boats and PWCs, \$75 for larger boats with up to two ballast tanks, and \$125 for ballast boats with 3 or more tanks. Non-registered vessels (kayaks, canoes, float tubes, etc.) do not have a fee attached to their decontamination. This change was largely successful as in 2019, only 10% of boaters showed up Clean, Drained, and Dry. Whereas, in 2020, 80% of boaters showed up Clean, Drained, and Dry.

APPENDIX A

--	--

1. WELCOME AND CALL TO ORDER

The Big Bear Watermaster meeting was called to order by Don Evenson at 1:30 p.m.

2. APPROVAL OF MINUTES

The minutes of the October 10, 2019, meeting were approved.

3. LAKE AND BEAR CREEK STATUS

Mike Stephenson reported that the current lake level is 60.85, 11.48 feet below full. The current lake releases are 0.85 CFS. The flow rate is 0.86 CFS at Station B.

Mr. Stephenson also provided an update on the Replenish Big Bear recycled water project. Mr. Stephenson said that they are meeting with Big Bear City DWP regarding constituents of concern. BBMWD also needs to identify if the lake is going to be an impoundment of recycled water. He indicated that the modeling to determine impoundment is rather difficult due to the number of releases and spills.

Mr. Evenson provided handouts for review. He said that Valley Municipal and Western had hired GeoScience to identify the impact of the Projection capture and recharge into the San Bernardino Basin. BBMWD will model the lake and how much of the reclaimed water will get into the lake and how much will spill and how much will end up going downstream. Mr. Evenson reviewed the project noting that compared to historic operations under the "no project" conditions there would need to be more releases for Mutual, 457 AF/yr.; more releases for fish, 137 AF/yr.; more use of fish releases by Mutual, 76 AF/yr.; less lake evaporation, 172 AF/yr.; more withdrawals for snowmaking, 188 AF/yr.; less flood control releases, 570 AF/yr.; lower

lake levels, 0.66 ft. (average); and lower lake storage at the end of 2018, 857 AF/yr. The lake would be down 4.31 ft. under no project conditions, and under historical conditions, it would be 3.51 ft. down. He reviewed the differences due to operational changes during the 1977 to 2018 period. Mr. Evenson reviewed the alternatives for Replenish Big Bear Project as follows:

1. Alternative 1 – 2,000 AF/ year reclaimed wastewater discharged into Stanfield Marsh
2. Alternative 2 – Add 120 AF/year for Golf Course indirect recharge
3. Alternative 3 – Add 80 AF/year for diversion to Shay Pond for Stickleback protection; leaves 1,920 AF/year to Stanfield Marsh
4. Alternative 4 – Add modifications to the Mutual and Flood Control Lake Release Policies to keep water in the lake for longer periods of time.

He noted that all alternatives have additional lake evaporation when the lake level is below the bottom of the culverts connecting the Marsh to the lake; a permanent pond of about 50 acres will remain in the Marsh when the lake level is below the bottom of the culverts. The reclaimed water will be discharged to this pond and then flow into the lake from the pond. Mr. Evenson reviewed the benefits of each alternative. The estimated increase ending storage for the lake on an annual basis per each alternative is noted as follows: Alternative 1) 218.4 AF; Alternative 2) 202.3 AF; Alternative 3) 193.0 AF, and Alternative 4) 218.5 AF. The total potential benefits to the downstream agencies are estimated as follows: Alternative 1) 1,333.8 AF; Alternative 2) 1,256.1 AF; Alternative 3) 1,201.7 AF and Alternative 4) 1,092.8 AF. Preliminary results indicate Valley District and Western would be able to capture an average of 224 to 277 AF/year under current recharge conditions and 332 to 393 AF/year under future recharge conditions. In addition, Valley District would provide between 96 and 315 AF/year less In Lieu water to Mutual. Director Stewart asked if any of the upper marshes if that could be used as cold storage or service reservoirs. Mr. Stephenson said that with the project, the Marsh is connected to the lake; when we get to the eleven and a half feet, they are connected.

4. SANTA ANA RIVER STATUS AND FLOW REPORT/EDISON FACILITIES

Ms. Scholte provided a verbal update. She said that Valley Municipal is performing maintenance on their facilities, so there are no imported water deliveries. The Santa Ana, Mill Creek, and SCE facilities have remained operational since December 2019. There is 30 CFS in Santa Ana that is going to Mutual, and since Hinckley is still down for maintenance, the District is recharging in lower Mill Creek facilities. The City of Redlands is taking water into their treatment plant, and Crafton Water is also taking water. The District is still performing maintenance on its facilities. Some of the ponds are wet, and the District is drying them out in order to perform maintenance; the Borrow Pit is still recharging well.

Mr. Cozad provided an update on the Memorandum of Understanding (MOU) between Valley Municipal, Mutual, and the Conservation District. Mr. Fuller said that Mutual met with Valley Municipal this morning to discuss the concept of trading water. Their staff expressed concern regarding Tres Lagos and Newport turnouts, which are locations where Mutual has in the past gotten In Lieu water and purchased water. Valley Municipal is concerned with the potential for the trading of water to be misconstrued as a gift of public funds. There is a question as to whether Mutual will be purchasing all of the water for those locations or not. Mr. Fuller provided a handout of the summary of deliveries of State Water Project Water and Well Water to Bear Valley Mutual Water Company by Valley Municipal. He noted that during all months of 2019, there was water available for groundwater recharge out of the Santa Ana River (SAR) that Mutual did not take for consumptive use. Mutual did not fully utilize SAR, but it was still recorded as in-lieu. Mr. Fuller said that the BBWM accounting assumes that on days Mutual purchases water, then the SAR was fully utilized by Mutual, but he said that was not the case last year.

Mr. Evenson said that there are instances where Mutual is not fully utilizing the river and is taking in-lieu. Mr. Fuller said that Mutual was not taking river water but the water was not lost, as it was being spread. Discussion ensued regarding delivery options and issues.

Mr. Cozad suggested the fish release calculation needs a policy that is not dependent on several human decisions noting that "fully utilized" may not be the proper terminology to use in this case related to fish releases. Before next year the BBWM should identify a more efficient way to divide the fishery releases, possibly by looking at historical flows. Mr. Fuller said that for this year's report, the Committee may want to determine if it will use a different consideration in determining what fully utilized means because Mutual did not fully utilize the flow of the river. Mr. Fuller said that he is hoping that the Exchange Plan includes Tres Lagos and Newport turnouts as exchange locations. Mr. Evenson proposed including a more general statement about when SCE is out of operations instead of a specific period; if SCE is out of operations, water should be subject to exchange. Mr. Cozad said that the first Exchange Plan workshop was held on December 13, and WSC looked at a wide variety of changes and met with all the Exchange Plan partners.

5. MUTUAL'S PROJECTION OF NEEDS FOR LAKE RELEASES/IN-LIEU WATER

Sam Fuller said that Mutual's projection of need is at 6,500 AF.

6. ANNUAL WATERMASTER ACCOUNTING, REPORT, TASKS AND DEADLINES

Mr. Evenson provided handouts to the Committee and reviewed them in detail. He reviewed preliminary data, the 2019 Lake, which ended the year at 11.44 feet from full. He reviewed the summary of the preliminary lake accounts for 2019. The lake account ending balance for 2019 is 42,590 AF. The 2019 Daily Total Releases and Leakage for Fish is 445.81 AF for the year. Station B's revised flow compliance requirements for 2019 were reviewed. There were 131 days that Mutual was estimated to have fully utilized the river. Mr. Evenson said that he could get a draft report out by March 10 for review and comment.

7. DATE FOR NEXT MEETING

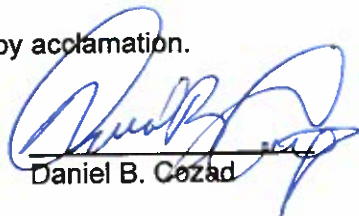

The next meeting will be on Wednesday, March 18, 2020, at 1:30 p.m. at the Water Conservation District.

8. ADJOURN

There being no further business, the meeting was adjourned by acclamation.

1. WELCOME AND CALL TO ORDER

The Big Bear Watermaster meeting was called to order by Don Evenson at 1:30 p.m.

2. APPROVAL OF MINUTES

Minute approval of the January 22, 2020 meeting was deferred until the next meeting.

3. LAKE AND BEAR CREEK STATUS

Mike Stephenson reported that the current lake level is 61.11 feet elevation; 11.22 feet below full. The flow rate is 0.92 CFS at Station B.

Mr. Stephenson also provided an update on the Replenish Big Bear recycled water project. Mr. Stephenson said that BBMWD is working with the Regional Board on permitting. It seems BBMWD will need to meet the basin objective and TMDL requirements to be able to discharge. If BBMWD meets the basin objective, approval will happen quickly. The TDS requirement is 175 ppm.

Mr. Evenson said that GeoScience is working on finalizing technical memorandum three. These are the results of the additional water that would be released from the lake based on the four different alternatives; what will be able to be used and captured. The results are still the same from the last meeting, and the plan is to finalize and for them not to perform the previous task. The amount that would be captured is lower than anticipated. However, the decrease in in-lieu deliveries has not been taken into account yet; that is another form of indirect recharge. The benefits will be widespread among the watershed.

4. SANTA ANA RIVER STATUS AND FLOW REPORT/EDISON FACILITIES

Mr. Cozad provided a verbal update. There are currently 17 CFS in Mill Creek, and SCE Powerhouse #1 is operating; water is being diverted to Mutual. Ms. Scholte indicated that SCE

Powerhouse #3 is still down for maintenance. She also said that most of the basins in Santa Ana side had been cleaned. Ms. Scholte noted that water is being diverted to Mutual through the Highline. The approximate total spread so far this year is 13,000 AF; the majority of that is State Water Project (SWP) water. The current SWP allocation is 15%.

Mr. Martin provided a brief update on the Memorandum of Understanding (MOU) between Valley Municipal, Mutual, and the Conservation District. He said that is scheduled to be presented for Board approval at Valley Municipal at the first meeting in April. The revised MOU will be considered that includes a lot of history of what that has occurred and how it will benefit the basin and recharge data. Mr. Evenson said that the current lake accounting assumes there will be exchanges between Valley Municipal and Mutual from February to August. Mr. Martin said that the MOU intends to consider the water during that period to be considered exchange water. Mr. Evenson asked about exchanges at Tres Lagos and Newport. Mr. Martin said that it might be included within the MOU.

5. MUTUAL'S PROJECTION OF NEEDS FOR LAKE RELEASES/IN-LIEU WATER

Mr. Fuller said that Mutual's projection of need is at 6,500 AF. He indicated that he is hopeful that there will be enough river flow to maintain Mutual through the end of the year.

6. ANNUAL WATERMASTER ACCOUNTING, REPORT, TASKS AND DEADLINES

Mr. Evenson stated that a review of accounting had been performed, and thus far, there are no changes to accounts since the January meeting. He said that Mr. Fuller provided great feedback, and those updates will be incorporated into the final report. Mr. Evenson said that the releases through the three-inch pipeline were more than usual this year. This year it has been utilized a little more since there was not enough flow through the six-inch line. Mr. Cozad indicated that the Conservation District does not have recommended revisions to the report. Mr. Evenson said that the cover letter would be circulated soon for signature.

7. DATE FOR NEXT MEETING

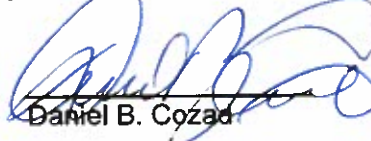

The next meeting will be on Wednesday, July 15, 2020, at 1:30 p.m. at the Water Conservation District.

8. ADJOURN

There being no further business, the meeting was adjourned by acclamation at 2:15 p.m.

1. WELCOME AND CALL TO ORDER

The Big Bear Watermaster meeting was called to order by Don Evenson at 1:30 p.m.

2. APPROVAL OF MINUTES

It was moved by Mr. Cozad and seconded by Mr. Evenson to approve the minutes of January 22, 2020, and March 28, 2020. The motion carried unanimously.

3. LAKE AND BEAR CREEK STATUS

Mike Stephenson reported that the current lake level is 61.59 feet elevation, 10.75 feet below full. The flow rate is 1.05 CFS at Station B. They are having a problem with leakage and will have to replace sluice gates. GEI is working on that and are at 90%; he will report back when he has more information.

Mr. Stephenson also provided an update on the Replenish Big Bear recycled water project. Mr. Stephenson said that a model is being done related to water quality; TDS is the main issue. Once that is done, it will be taken back to the Regional Board for review. BBMWD currently has \$7 million in grant money, another \$2.5 million is on the line.

Mr. Evenson provided a brief update on the GeoScience work to evaluate the benefits of the Replenish Big Bear Project. Their analysis covers the 42 water years from WY 1976-77 through WY 2017-18. The following results describe the downstream benefits of adding 2,000 AF per year of reclaimed water to Big Bear Lake for the Replenish Big Bear Project Alternative No. 4. The results are based on existing recharge conditions in the San Bernardino Basin. BBMWD estimated the average annual increase in the outflow from the lake for this alternative would be 1,085 AF per year and provided the data to Geoscience for use in their models of the SAR Watershed. GeoScience's models identified how much of that outflow would be used by downstream agencies. Mutual's average annual increase in diversions of the Lake outflow would 96 AF per year. The streambed ET and groundwater recharge between Bear Valley Dam and Seven Oaks Dam was estimated to be 133 AF per year. The result would be an average increase

of 856 AF per year of additional inflow into Seven Oaks Dam (SOD), which would increase the SOD lake evaporation losses by 2 AF per year. The result would be an additional 854 AF per year released from SOD. Under current recharge conditions, there would be an average increase of 109 AF per year that would be diverted at Cuttle Weir for groundwater recharge and 745 AF per year would flow past Cuttle Weir. Of that total, 168 AF per year would percolate in the Santa Ana Riverbed below Cuttle Weir into the San Bernardino Groundwater Basin. The remaining 577 AF per year would flow down to Prado Dam and would be available to Orange County Water District for potential diversion and recharge. The benefits of the project are widespread throughout the SAR Watershed.

4. SANTA ANA RIVER STATUS AND FLOW REPORT/EDISON FACILITIES

Ms. Scholte indicated that there is 30 CFS in Mill Creek and 15 CFS in SAR. The SCE Powerhouse is off, and on Mill Creek side, Powerhouse #1 is generating, and Powerhouse#3 should be generating within a few weeks. 6 CFS is coming across the Highline, and an additional 3 CFS is coming down the rockdrop.

Mr. Martin provided an update on the Memorandum of Understanding (MOU). He reviewed the history of the issues in brief. Mutual approached Valley Municipal with an exchange concept, and each agency adopted it.

Mr. Cozad provided an update on the Exchange Plan efforts. There was a detailed matrix of changes; which will expand smart water management. The Exchange Plan Committee is currently waiting for the members to submit comments on the current draft to WSC. There will likely be a meeting to approve the final version. Out of the Exchange Plan discussions came a group that is working together on the SCE divestiture. The letter from Valley Municipal was reviewed with the Committee. Valley Municipal, Bear Valley Mutual, East Valley Water District (Northfork), City of Redlands, and the Conservation District are members working on divestiture. Valley Municipal, Mutual, and Conservation District have been on calls with SCE to discuss potential divestiture. There has been discussion of developing a JPA to manage these facilities.

5. MUTUAL'S PROJECTION OF NEEDS FOR LAKE RELEASES/IN-LIEU WATER

Mr. Fuller said that Mutual's would try to keep it well under 6,500 AF. He indicated that the MOU entered into made the numbers published in the BBWM report accurate. He anticipates there will be another exchange this year. Mr. Fuller discussed the SCE 41 inch pipeline and how it relates to the 1904 Power Agreement.

6. ANNUAL WATERMASTER ACCOUNTING AND ANNUAL REPORTING

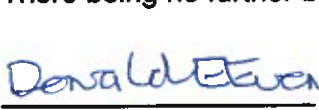

Mr. Evenson reviewed the 2020 lake levels, which are well below the requirements for Lake releases for Mutual. Consequently, there will be no lake release for Mutual this year. He reviewed the preliminary lake account status. The year started at 42,590 AF, and at the end of June, it was 47,685 AF. Mutual's lake account started at 23,612 AF and at the end of June was 30,377 AF. BBWWD's account began at 18,978 AF and at the end of June was 17,308 AF.

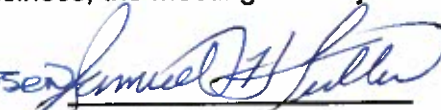

7. DATE FOR NEXT MEETING

The next meeting will be on Wednesday, October 13, 2020, at 1:30 p.m. at the Water Conservation District.

8. ADJOURN

There being no further business, the meeting was adjourned by acclamation at 2:31 p.m.

1. WELCOME AND CALL TO ORDER

The Big Bear Watermaster meeting was called to order by Don Evenson at 1:30 p.m.

2. APPROVAL OF MINUTES

It was moved by Mr. Cozad and seconded by Mr. Fuller to approve the minutes of July 15, 2020, that were emailed out to the Committee. The motion carried unanimously.

3. LAKE AND BEAR CREEK STATUS

Mr. Ludecke provided a brief update in Mr. Stephenson's absence on the Recycled Water Project. He indicated that BBMWD is awaiting analysis and reports. Mr. Fuller asked about the Bear Valley Basin Groundwater Sustainability Agency (BVBGSA). He expressed concern over their need for additional water and the potential for them to take that water from the stream courses. Mr. Ludecke is the President of that agency and indicated that it is a complex project, and it is still in the early stages. He believed that the additional water needed will come from the wastewater treatment plant. Mr. Evenson provided an analysis for the sustainability agency, and a brief discussion ensued. He explained the need is estimated to be 2000 AF/year. Mr. Evenson said that the benefits of BVBGSA; approximately half of the additional water would be used for the Big Bear Watershed, potentially for fisheries use, golf course irrigation, recharge, and may increase storage of water in the lake. The other half will be released from the lake; Mutual will be able to divert part of it, and the remaining will go into Seven Oaks Dam and be released. Additional benefits were discussed.

Mr. Evenson reviewed the 2020 Lake Level included on package page 4; the lake is 12.23 feet below full as of October 1. There will be in-lieu deliveries to meet Mutual's needs. The current requirement to meet fisheries needs is 1.2 CFS; currently releasing 1.3 CFS from the lake at Station A. The Station B requirement in October is also 1.2 CFS.

Mr. Evenson reviewed the Preliminary Lake Account status shown on package page 5. The year began at 42,591 AF and ended the year at 40,717 AF, decreasing by 1,873 AF. Mutual's Lake Account began at 23,612 AF and ended the water year, September 30, 2020 at 22,990 AF, decreasing by 621 AF. BBMWd's Lake Account began at 18,979 AF and ended the year at 17,727 AF; a decrease of 1,252 AF.

Mr. Evenson indicated that the only numbers that are subject to a potential change are the Wastewater Export Credits and the allocation from the State Water Resources Control Board. He asked if there is an allocation prediction from the State Water Project. Mr. Evenson noted that Station A is damaged, and BBMWd is looking to eliminate the requirement to have a gauging station at Station A and potentially only have Station B.

4. SANTA ANA RIVER STATUS AND FLOW REPORT/EDISON FACILITIES

Mr. Cozad stated that the water year ended on September 30 with Mill Creek at 7,350 AF and 23,000 AF in the Santa Ana River; approximately 31,000 AF. He credited the Groundwater Council (GC) that helped provide a portion of the water and expressed his appreciation for Conservation District Field Staff for their efforts. Ms. Scholte said that the Santa Ana River has been holding at 20 CFS, and Mill Creek is at 12 CFS. She indicated that Southern California Edison (SCE) is postponing maintenance due to COVID. There has been minimal usage of State Water Project (SWP) water, with some going to East Valley Water District's (EVWD) treatment plant and Redlands Aqueduct. Mr. Evenson said that because SCE is offline that some flows are going to the Seven Oaks Dam; Mutual has been able to meet some of their needs from those releases. Ms. Scholte said that approximately 12 CFS had been released from the dam, and the rest is coming across the Highline. The water received by the Conservation District came to the District through Northfork/EVWD for credit under the GC.

Mr. Cozad provided a brief update on the Exchange Plan; the Exchange Plan Committee (Committee) completed most of their work updating the agreement and exhibits. Conservation District Legal Counsel is reviewing these revisions, and the Committee should have something to review by the end of this month.

5. MUTUAL'S PROJECTION OF NEEDS FOR LAKE RELEASES/IN-LIEU WATER

Mr. Fuller indicated that Mutual had received approximately 2000 AF from Valley Municipal, which may be considered in-lieu water. He said that Mutual projects a need for an additional 2000 AF and would likely end the water year around 4,000 AF. The preliminary draft of the summary of SWP water deliveries and well water to Mutual by Valley Municipal included on package page 6 was reviewed.

6. ANNUAL WATERMASTER ACCOUNTING AND ANNUAL REPORTING

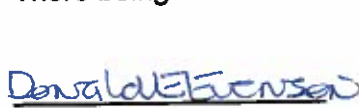

Mr. Evenson reviewed the Watermaster Report schedule. The report is due to the court by March 30. The final in-lieu values are expected to be received by the first week of February, and Mr. Evenson will be working with Ms. Scholte on the fisheries allocation in January/early February. February 19 is the goal to get the lake accounts updated and out to Committee for review. The draft report will be sent out by March 12 for consideration. The Watermaster Committee is anticipated to have a meeting for review of the draft report no later than March 23.

7. DATE FOR NEXT MEETING

The next meeting will be on Wednesday, January 20, 2021, at 1:30 p.m. via Zoom.

8. ADJOURN

There being no further business, the meeting was adjourned by acclamation at 2:18 p.m.
